[61383] Another function of VGAM1853 is therefore inhibition of LOC83690 (Accession NM\_031461). Accordingly, utilities of VGAM1853 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83690. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1854 (VGAM1854) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61384] VGAM1854 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1854 was detected is described hereinabove with reference to Figs. 1–8.

[61385] VGAM1854 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpea Chlorotic Mottle Virus. VGAM1854 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61386] VGAM1854 gene encodes a VGAM1854 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1854 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1854 precursor RNA is designated SEQ ID:1840, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1840 is located at position 1253 relative to the genome of Cowpea Chlorotic Mottle Virus.

[61387] VGAM1854 precursor RNA folds onto itself, forming VGAM1854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61388] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1854 folded precursor RNA into VGAM1854

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1854 RNA is designated SEQ ID:4565, and is provided hereinbelow with reference to the sequence listing part.

[61389] VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1854 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61390] VGAM1854 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1854 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1854 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61391] The complementary binding of VGAM1854 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1854 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1854 host target RNA into VGAM1854 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[61392] It is appreciated that VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1854 host target genes. The mRNA of each one of this plurality of VGAM1854 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1854 RNA, herein designated VGAM RNA, and which when bound by VGAM1854 RNA causes inhibition of translation of respective one or more VGAM1854 host target proteins.

[61393] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1854 gene, herein designated VGAM GENE, on one or more VGAM1854 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61394] It is yet further appreciated that a function of VGAM1854 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1854 include diagnosis, prevention and treatment of viral infection by Cowpea Chlorotic Mottle Virus. Specific functions, and accordingly utilities, of VGAM1854 correlate with, and may be deduced from, the identity of the host target genes which VGAM1854 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61395] Nucleotide sequences of the VGAM1854 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1854 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1854 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1854 are further described hereinbelow with reference to Table 1.

[61396] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1854 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1854 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61397] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1854 gene, herein designated VGAM is inhibition of expression of VGAM1854 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1854 correlate with, and may be deduced from, the identity of the target genes which VGAM1854 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61398] TEA Domain Family Member 3 (TEAD3, Accession NM\_003214) is a VGAM1854 host target gene. TEAD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEAD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEAD3 BINDING SITE, designated SEQ ID:9214, to the nucleotide sequence of VGAM1854 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4565.

[61399] A function of VGAM1854 is therefore inhibition of TEA Domain Family Member 3 (TEAD3, Accession NM\_003214), a gene which binds to multiple functional elements of the human chorionic somatomammotropin- $\beta$  gene enhancer. Accordingly, utilities of VGAM1854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEAD3. The function of TEAD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM299.FLJ14442 (Accession NM\_032785) is another VGAM1854 host target gene. FLJ14442 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14442, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14442 BINDING SITE, designated SEQ ID:26535, to the nucleotide sequence of VGAM1854 RNA, herein designated VGAM RNA, also designated SEQ ID:4565.

[61400] Another function of VGAM1854 is therefore inhibition of FLJ14442 (Accession NM\_032785). Accordingly, utilities of

VGAM1854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14442. LOC150998 (Accession XM\_097990) is another VGAM1854 host target gene. LOC150998 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150998, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150998 BINDING SITE, designated SEQ ID:41286, to the nucleotide sequence of VGAM1854 RNA, herein designated VGAM RNA, also designated SEQ ID:4565.

[61401] Another function of VGAM1854 is therefore inhibition of LOC150998 (Accession XM\_097990). Accordingly, utilities of VGAM1854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150998. LOC256096 (Accession XM\_173164) is another VGAM1854 host target gene. LOC256096 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256096 BINDING SITE, designated SEQ ID:46419, to the nucleotide sequence of VGAM1854 RNA, herein designated VGAM RNA, also designated SEQ ID:4565.

[61402] Another function of VGAM1854 is therefore inhibition of LOC256096 (Accession XM\_173164). Accordingly, utilities of VGAM1854 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256096. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1855 (VGAM1855) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61403] VGAM1855 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1855 was detected is described hereinabove with reference to Figs. 1–8.

[61404] VGAM1855 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sonchus Yellow Net Virus. VGAM1855 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61405] VGAM1855 gene encodes a VGAM1855 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1855 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1855 precursor RNA is designated SEQ ID:1841, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1841 is located at position 8120 relative to the genome of Sonchus Yellow Net Virus.

[61406] VGAM1855 precursor RNA folds onto itself, forming VGAM1855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61407] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1855 folded precursor RNA into VGAM1855 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1855 RNA is designated SEQ ID:4566, and is provided hereinbelow with reference to the sequence listing part.

[61408] VGAM1855 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1855 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61409] VGAM1855 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1855 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1855 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61410] The complementary binding of VGAM1855 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1855 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1855 host target RNA into VGAM1855 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61411] It is appreciated that VGAM1855 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1855 host target genes. The mRNA of each one of this plurality of VGAM1855 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1855 RNA, herein designated VGAM RNA, and which when bound by VGAM1855 RNA causes inhibition of translation of respective one or more VGAM1855 host target proteins.

[61412] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1855 gene, herein designated VGAM GENE, on one or more VGAM1855 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[61413] It is yet further appreciated that a function of VGAM1855 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1855 include diagnosis, prevention and treatment of viral infection by Sonchus Yellow Net Virus. Specific functions, and accordingly utilities, of VGAM1855 correlate with, and may be deduced from, the identity of the host target genes which VGAM1855 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61414] Nucleotide sequences of the VGAM1855 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1855 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1855 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1855 are further described hereinbelow with reference to Table 1.

[61415] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1855 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1855 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61416] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1855 gene, herein designated VGAM is inhibition of expression of VGAM1855 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1855 correlate with, and may be deduced from, the identity of the target genes which VGAM1855 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61417] Collagen, Type XV, Alpha 1 (COL15A1, Accession NM\_001855) is a VGAM1855 host target gene. COL15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL15A1 BINDING SITE, designated SEQ ID:7587, to the nucleotide sequence of VGAM1855 RNA, herein designated VGAM RNA, also designated SEQ ID:4566.

[61418] A function of VGAM1855 is therefore inhibition of Collagen, Type XV, Alpha 1 (COL15A1, Accession NM\_001855), a gene which may be involved in maintaining the structure of connective tissue. Accordingly, utilities of VGAM1855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL15A1. The function of COL15A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM304. Myosin IC (MYO1C, Accession XM\_028385) is another VGAM1855 host target gene. MYO1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1C BINDING SITE, designated SEQ ID:30697, to the nucleotide sequence of VGAM1855 RNA, herein designated VGAM RNA, also designated SEQ ID:4566.

[61419] Another function of VGAM1855 is therefore inhibition of Myosin IC (MYO1C, Accession XM\_028385), a gene which participates in adaptation in hair cells. Accordingly, utilities of VGAM1855 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with MYO1C. The function of MYO1C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.DKFZp564I1922 (Accession NM\_015419) is another VGAM1855 host target gene. DKFZp564I1922 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp564I1922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp564I1922 BINDING SITE, designated SEQ ID:17721, to the nucleotide sequence of VGAM1855 RNA, herein designated VGAM RNA, also designated SEQ ID:4566.

[61420] Another function of VGAM1855 is therefore inhibition of DKFZp564I1922 (Accession NM\_015419). Accordingly, utilities of VGAM1855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp564I1922. KIAA1579 (Accession NM\_018211) is another VGAM1855 host target gene. KIAA1579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1579, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1579 BINDING SITE, designated SEQ ID:20116, to the nucleotide sequence of VGAM1855 RNA, herein designated VGAM RNA, also designated SEQ ID:4566.

[61421] Another function of VGAM1855 is therefore inhibition of KIAA1579 (Accession NM\_018211). Accordingly, utilities of VGAM1855 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1579. LOC219686 (Accession XM\_165544) is another VGAM1855 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43671, to the nucleotide sequence of VGAM1855 RNA, herein designated VGAM RNA, also designated SEQ ID:4566.

[61422] Another function of VGAM1855 is therefore inhibition of LOC219686 (Accession XM\_165544). Accordingly, utilities of VGAM1855 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC219686. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1856 (VGAM1856) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61423] VGAM1856 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1856 was detected is described hereinabove with reference to Figs. 1–8.

[61424] VGAM1856 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61425] VGAM1856 gene encodes a VGAM1856 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1856 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1856 precursor RNA is desig-

nated SEQ ID:1842, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1842 is located at position 13503 relative to the genome of Rice Yellow Stunt Virus.

- [61426] VGAM1856 precursor RNA folds onto itself, forming VGAM1856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [61427] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1856 folded precursor RNA into VGAM1856 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1856 RNA is designated SEQ ID:4567, and is provided hereinbelow with reference to the sequence

listing part.

[61428] VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1856 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61429] VGAM1856 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1856 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1856 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[61430] The complementary binding of VGAM1856 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1856 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1856 host target RNA into VGAM1856 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61431] It is appreciated that VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1856 host target genes. The mRNA of each one of this plurality of VGAM1856 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1856 RNA, herein designated VGAM

RNA, and which when bound by VGAM1856 RNA causes inhibition of translation of respective one or more VGAM1856 host target proteins.

[61432] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1856 gene, herein designated VGAM GENE, on one or more VGAM1856 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61433] It is yet further appreciated that a function of VGAM1856 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1856 include diagnosis, prevention and treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM1856 correlate with, and may be deduced from, the identity of the host target genes which VGAM1856 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61434] Nucleotide sequences of the VGAM1856 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1856 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1856 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1856 are further described hereinbelow with reference to Table 1.

[61435] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1856 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1856 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61436] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1856 gene, herein designated VGAM is

inhibition of expression of VGAM1856 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1856 correlate with, and may be deduced from, the identity of the target genes which VGAM1856 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61437] UC28 (Accession NM\_021635) is a VGAM1856 host target gene. UC28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UC28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UC28 BINDING SITE, designated SEQ ID:22279, to the nucleotide sequence of VGAM1856 RNA, herein designated VGAM RNA, also designated SEQ ID:4567.

[61438] A function of VGAM1856 is therefore inhibition of UC28 (Accession NM\_021635). Accordingly, utilities of VGAM1856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UC28. KIAA1463 (Accession XM\_051160) is another VGAM1856 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35770, to the nucleotide sequence of VGAM1856 RNA, herein designated VGAM RNA, also designated SEQ ID:4567.

[61439] Another function of VGAM1856 is therefore inhibition of KIAA1463 (Accession XM\_051160). Accordingly, utilities of VGAM1856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. OBTP (Accession NM\_017601) is another VGAM1856 host target gene. OBTP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OBTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OBTP BINDING SITE, designated SEQ ID:19077, to the nucleotide sequence of VGAM1856 RNA, herein designated VGAM RNA, also designated SEQ ID:4567.

[61440] Another function of VGAM1856 is therefore inhibition of OBTP (Accession NM\_017601). Accordingly, utilities of VGAM1856 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with OBTP. Protocadherin 20 (PCDH20, Accession NM\_022843) is another VGAM1856 host target gene. PCDH20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH20 BINDING SITE, designated SEQ ID:23135, to the nucleotide sequence of VGAM1856 RNA, herein designated VGAM RNA, also designated SEQ ID:4567.

[61441] Another function of VGAM1856 is therefore inhibition of Protocadherin 20 (PCDH20, Accession NM\_022843). Accordingly, utilities of VGAM1856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH20. LOC153020 (Accession XM\_087578) is another VGAM1856 host target gene. LOC153020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153020 BINDING SITE, desig-

nated SEQ ID:39353, to the nucleotide sequence of VGAM1856 RNA, herein designated VGAM RNA, also designated SEQ ID:4567.

[61442] Another function of VGAM1856 is therefore inhibition of LOC153020 (Accession XM\_087578). Accordingly, utilities of VGAM1856 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153020. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1857 (VGAM1857) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61443] VGAM1857 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1857 was detected is described hereinabove with reference to Figs. 1–8.

[61444] VGAM1857 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61445] VGAM1857 gene encodes a VGAM1857 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1857 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1857 precursor RNA is designated SEQ ID:1843, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1843 is located at position 9634 relative to the genome of Rice Yellow Stunt Virus.

[61446] VGAM1857 precursor RNA folds onto itself, forming VGAM1857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1857 folded precursor RNA into VGAM1857 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1857 RNA is designated SEQ ID:4568, and is provided hereinbelow with reference to the sequence listing part.

[61448] VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1857 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61449] VGAM1857 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1857 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1857 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61450] The complementary binding of VGAM1857 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1857 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1857 host target RNA into VGAM1857 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61451] It is appreciated that VGAM1857 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1857 host target genes. The mRNA of each one of this plurality of VGAM1857 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1857 RNA, herein designated VGAM RNA, and which when bound by VGAM1857 RNA causes inhibition of translation of respective one or more VGAM1857 host target proteins.

[61452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1857 gene, herein designated VGAM GENE, on one or more VGAM1857 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[61453] It is yet further appreciated that a function of VGAM1857 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM1857 correlate with, and may be deduced from, the identity of the host target genes which VGAM1857 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61454] Nucleotide sequences of the VGAM1857 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1857 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1857 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1857 are further described hereinbelow with reference to Table 1.

[61455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1857 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1857 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1857 gene, herein designated VGAM is inhibition of expression of VGAM1857 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1857 correlate with, and may be deduced from, the identity of the target genes which VGAM1857 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61457] Alcohol Dehydrogenase IB (class I), Beta Polypeptide (ADH1B, Accession XM\_052365) is a VGAM1857 host target gene. ADH1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADH1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH1B BINDING SITE, designated SEQ ID:35961, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61458] A function of VGAM1857 is therefore inhibition of Alcohol Dehydrogenase IB (class I), Beta Polypeptide (ADH1B, Accession XM\_052365), a gene which Alcohol dehydrogenase 2 (alcohol:NAD<sup>+</sup> oxidoreductase) class I beta subunit. Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH1B. The function of ADH1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1805.Secretory Carrier Membrane Protein 1 (SCAMP1, Accession NM\_004866) is another VGAM1857 host target gene. SCAMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP1 BINDING SITE, designated SEQ ID:11290, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61459] Another function of VGAM1857 is therefore inhibition of Secretory Carrier Membrane Protein 1 (SCAMP1, Accession

NM\_004866), a gene which functions in post-golgi recycling pathways and acts as a recycling carrier to the cell surface. Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP1. The function of SCAMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM366. Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM\_000452) is another VGAM1857 host target gene. SLC10A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC10A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC10A2 BINDING SITE, designated SEQ ID:6063, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61460] Another function of VGAM1857 is therefore inhibition of Solute Carrier Family 10 (sodium/bile acid cotransporter family), Member 2 (SLC10A2, Accession NM\_000452). Ac-

cordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC10A2. FLJ20457 (Accession NM\_017832) is another VGAM1857 host target gene. FLJ20457 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20457 BINDING SITE, designated SEQ ID:19496, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61461] Another function of VGAM1857 is therefore inhibition of FLJ20457 (Accession NM\_017832). Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20457. KIAA1223 (Accession XM\_048747) is another VGAM1857 host target gene. KIAA1223 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1223 BINDING SITE, designated SEQ ID:35247, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61462] Another function of VGAM1857 is therefore inhibition of KIAA1223 (Accession XM\_048747). Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1223. YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM\_139312) is another VGAM1857 host target gene. YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by YME1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2, designated SEQ ID:29294 and SEQ ID:15538 respectively, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61463] Another function of VGAM1857 is therefore inhibition of YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM\_139312). Accordingly, utilities of VGAM1857 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with YME1L1. LOC256925 (Accession XM\_175065) is another VGAM1857 host target gene. LOC256925 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256925 BINDING SITE, designated SEQ ID:46611, to the nucleotide sequence of VGAM1857 RNA, herein designated VGAM RNA, also designated SEQ ID:4568.

[61464] Another function of VGAM1857 is therefore inhibition of LOC256925 (Accession XM\_175065). Accordingly, utilities of VGAM1857 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256925. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1858 (VGAM1858) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61465] VGAM1858 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1858 was detected is described hereinabove with reference to Figs. 1–8.

[61466] VGAM1858 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61467] VGAM1858 gene encodes a VGAM1858 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1858 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1858 precursor RNA is designated SEQ ID:1844, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1844 is located at position 4741 relative to the genome of Rice Yellow Stunt Virus.

[61468] VGAM1858 precursor RNA folds onto itself, forming VGAM1858 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61469] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1858 folded precursor RNA into VGAM1858 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1858 RNA is designated SEQ ID:4569, and is provided hereinbelow with reference to the sequence listing part.

[61470] VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1858 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[61471] VGAM1858 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1858 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1858 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61472] The complementary binding of VGAM1858 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1858 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1858 host target RNA into VGAM1858 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61473] It is appreciated that VGAM1858 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1858 host target genes. The mRNA of each one of this plurality of VGAM1858 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1858 RNA, herein designated VGAM RNA, and which when bound by VGAM1858 RNA causes inhibition of translation of respective one or more VGAM1858 host target proteins.

[61474] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1858 gene, herein designated VGAM GENE, on one or more VGAM1858 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61475] It is yet further appreciated that a function of VGAM1858 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM1858 correlate with, and may be deduced from, the identity of the host target genes which VGAM1858 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61476] Nucleotide sequences of the VGAM1858 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1858 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1858 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1858 are further  
described hereinbelow with reference to Table 1.

[61477] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1858 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1858 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[61478] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1858 gene, herein designated VGAM is  
inhibition of expression of VGAM1858 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1858 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1858  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[61479] Glucosaminyl (N-acetyl) Transferase 2, I-branching En-  
zyme (GCNT2, Accession NM\_001491) is a VGAM1858

host target gene. GCNT2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT2 BINDING SITE, designated SEQ ID:7239, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61480] A function of VGAM1858 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 2, I-branching Enzyme (GCNT2, Accession NM\_001491), a gene which converts linear into branched poly-n-acetyllactosaminoglycans. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT2. The function of GCNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM943. Lactate Dehydrogenase B (LDHB, Accession NM\_002300) is another VGAM1858 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LDHB, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8091, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61481] Another function of VGAM1858 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM\_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310) is another VGAM1858 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:12998, to the nucleotide se-

quence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61482] Another function of VGAM1858 is therefore inhibition of Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS. The function of NPEPPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83. Protein Tyrosine Phosphatase, Receptor Type, K (PTPRK, Accession NM\_002844) is another VGAM1858 host target gene. PTPRK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRK BINDING SITE, designated SEQ ID:8733, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61483] Another function of VGAM1858 is therefore inhibition of

Protein Tyrosine Phosphatase, Receptor Type, K (PTPRK, Accession NM\_002844), a gene which regulates of processes involving cell contact and adhesion. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRK. The function of PTPRK has been established by previous studies. For general information about receptor-type protein-tyrosine phosphatases (PTPs), see PTPRA (OMIM Ref. No. 176884). Yang et al. (1997) used degenerate PCR to identify novel receptor PTPs in a human keratinocyte cDNA library. One of the genes identified was the human homolog of mouse PTPR-kappa. Human PTPR-kappa encodes a 1,440-amino acid polypeptide that is 98% identical to mouse PTPR-kappa. Northern blotting revealed that PTPR-kappa is expressed as a 7.0-kb transcript in a variety of tissues. Fuchs et al. (1996) also used degenerate PCR to clone human PTPR-kappa. Northern blotting revealed expression of PTPR-kappa in mammary carcinoma cell lines as well as in various tissues. Fuchs et al. (1996) noted that PTPR-kappa has several structural features, such as a MAM domain, an Ig-like domain, and fibronectin repeats, suggesting that it could be involved in cell adhesion. They showed that PTPR-kappa forms a

complex with beta-catenin (OMIM Ref. No. 116806) and gamma-catenin/plakoglobin (OMIM Ref. No. 173325).

They also showed that PTPR-kappa expression is dependent on cell density and that it colocalizes with catenins at adherens junctions. These findings suggest that PTPR-kappa may have a role in the regulation of processes involving cell contact and adhesion.

[61484] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61485] Fuchs, M.; Muller, T.; Lerch, M. M.; Ullrich, A. : Association of human protein-tyrosine phosphatase kappa with members of the armadillo family. J. Biol. Chem. 271: 16712-16719, 1996. ; and

[61486] Yang, Y.; Gil, M. C.; Choi, E. Y.; Park, S. H.; Pyun, K. H.; Ha, H. : Molecular cloning and chromosomal localization of a human gene homologous to the murine R-PTP-kappa, a receptor-type.

[61487] Further studies establishing the function and utilities of PTPRK are found in John Hopkins OMIM database record ID 602545, and in cited publications numbered 5873-5875 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein

Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_002848) is another VGAM1858 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:8739, SEQ ID:25004, SEQ ID:25012, SEQ ID:25021 and SEQ ID:25031 respectively, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61488] Another function of VGAM1858 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_002848), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM140.Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624) is another VGAM1858 host target gene. VIPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR1 BINDING SITE, designated SEQ ID:10991, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61489] Another function of VGAM1858 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624), a gene which binds vip and is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR1. The function of VIPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM548.Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM\_003678) is another VGAM1858 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:9774, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61490] Another function of VGAM1858 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM\_003678). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19. DKFZp547D155 (Accession XM\_046977) is another VGAM1858 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547D155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34869, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61491] Another function of VGAM1858 is therefore inhibition of DKFZp547D155 (Accession XM\_046977). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. E74-like Factor 2 (ets domain transcription factor) (ELF2, Accession NM\_006874) is another VGAM1858 host target gene. ELF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF2 BINDING SITE, designated SEQ ID:13744, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61492] Another function of VGAM1858 is therefore inhibition of E74-like Factor 2 (ets domain transcription factor) (ELF2, Accession NM\_006874). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF2. FLJ10648 (Accession NM\_018167) is another VGAM1858 host target gene. FLJ10648 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ10648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10648 BINDING SITE, designated SEQ ID:19985, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61493] Another function of VGAM1858 is therefore inhibition of FLJ10648 (Accession NM\_018167). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10648. FLJ20432 (Accession NM\_017819) is another VGAM1858 host target gene. FLJ20432 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20432 BINDING SITE, designated SEQ ID:19466, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61494] Another function of VGAM1858 is therefore inhibition of FLJ20432 (Accession NM\_017819). Accordingly, utilities of

VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20432. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM\_002077) is another VGAM1858 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7862, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61495] Another function of VGAM1858 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM\_002077). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. KIAA0193 (Accession NM\_014766) is another VGAM1858 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16543, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61496] Another function of VGAM1858 is therefore inhibition of KIAA0193 (Accession NM\_014766). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA0746 (Accession XM\_045277) is another VGAM1858 host target gene. KIAA0746 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0746 BINDING SITE, designated SEQ ID:34414, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61497] Another function of VGAM1858 is therefore inhibition of KIAA0746 (Accession XM\_045277). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0746. KIAA1041 (Accession NM\_014947) is another VGAM1858 host target gene. KIAA1041 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1041, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1041 BINDING SITE, designated SEQ ID:17264, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61498] Another function of VGAM1858 is therefore inhibition of KIAA1041 (Accession NM\_014947). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1041. KIAA1219 (Accession XM\_028835) is another VGAM1858 host target gene. KIAA1219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1219 BINDING SITE, designated SEQ ID:30758, to the nucleotide sequence of VGAM1858 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4569.

[61499] Another function of VGAM1858 is therefore inhibition of KIAA1219 (Accession XM\_028835). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1219. Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM\_004735) is another VGAM1858 host target gene. LRRFIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRRFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP1 BINDING SITE, designated SEQ ID:11120, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61500] Another function of VGAM1858 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM\_004735). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP1. NIR3 (Accession XM\_038799) is another VGAM1858 host target gene. NIR3 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ ID:32929, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61501] Another function of VGAM1858 is therefore inhibition of NIR3 (Accession XM\_038799). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM\_020168) is another VGAM1858 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK6 BINDING SITE, designated SEQ ID:21392, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61502] Another function of VGAM1858 is therefore inhibition of

p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM\_020168). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. Syntaphilin (SNPH, Accession NM\_014723) is another VGAM1858 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNPH BINDING SITE, designated SEQ ID:16296, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61503] Another function of VGAM1858 is therefore inhibition of Syntaphilin (SNPH, Accession NM\_014723). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. TP53TG3 (Accession NM\_015369) is another VGAM1858 host target gene. TP53TG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TP53TG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TP53TG3 BINDING SITE, designated SEQ ID:17671, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61504] Another function of VGAM1858 is therefore inhibition of TP53TG3 (Accession NM\_015369). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53TG3. Ubiquitin Specific Protease 24 (USP24, Accession XM\_165973) is another VGAM1858 host target gene. USP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP24 BINDING SITE, designated SEQ ID:43818, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61505] Another function of VGAM1858 is therefore inhibition of Ubiquitin Specific Protease 24 (USP24, Accession XM\_165973). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with USP24. LOC151571 (Accession XM\_098088) is another VGAM1858 host target gene. LOC151571 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151571 BINDING SITE, designated SEQ ID:41372, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61506] Another function of VGAM1858 is therefore inhibition of LOC151571 (Accession XM\_098088). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151571. LOC196337 (Accession XM\_113696) is another VGAM1858 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:42359, to

the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61507] Another function of VGAM1858 is therefore inhibition of LOC196337 (Accession XM\_113696). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. LOC221341 (Accession XM\_167239) is another VGAM1858 host target gene. LOC221341 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221341 BINDING SITE, designated SEQ ID:44619, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61508] Another function of VGAM1858 is therefore inhibition of LOC221341 (Accession XM\_167239). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221341. LOC54505 (Accession XM\_042110) is another VGAM1858 host target gene. LOC54505 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC54505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54505 BINDING SITE, designated SEQ ID:33695, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61509] Another function of VGAM1858 is therefore inhibition of LOC54505 (Accession XM\_042110). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54505. LOC54516 (Accession NM\_019041) is another VGAM1858 host target gene. LOC54516 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54516 BINDING SITE, designated SEQ ID:21123, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61510] Another function of VGAM1858 is therefore inhibition of LOC54516 (Accession NM\_019041). Accordingly, utilities

of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54516. LOC90917 (Accession XM\_034861) is another VGAM1858 host target gene. LOC90917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90917 BINDING SITE, designated SEQ ID:32170, to the nucleotide sequence of VGAM1858 RNA, herein designated VGAM RNA, also designated SEQ ID:4569.

[61511] Another function of VGAM1858 is therefore inhibition of LOC90917 (Accession XM\_034861). Accordingly, utilities of VGAM1858 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90917. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1859 (VGAM1859) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61512] VGAM1859 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1859 was detected is described hereinabove with reference to Figs. 1–8.

[61513] VGAM1859 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61514] VGAM1859 gene encodes a VGAM1859 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1859 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1859 precursor RNA is designated SEQ ID:1845, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1845 is located at position 3094 relative to the genome of Rice Yellow Stunt Virus.

[61515] VGAM1859 precursor RNA folds onto itself, forming VGAM1859 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61516] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1859 folded precursor RNA into VGAM1859 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM1859 RNA is designated SEQ ID:4570, and is provided hereinbelow with reference to the sequence listing part.

[61517] VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1859 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[61518] VGAM1859 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1859 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1859 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61519] The complementary binding of VGAM1859 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1859 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1859 host target RNA into VGAM1859 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61520] It is appreciated that VGAM1859 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1859 host target genes. The mRNA of each one of this plurality of VGAM1859 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1859 RNA, herein designated VGAM RNA, and which when bound by VGAM1859 RNA causes inhibition of translation of respective one or more VGAM1859 host target proteins.

[61521] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1859 gene, herein designated VGAM GENE, on one or more VGAM1859 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61522] It is yet further appreciated that a function of VGAM1859 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM1859 correlate with, and may be deduced from, the identity of the host target genes which VGAM1859 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61523] Nucleotide sequences of the VGAM1859 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1859 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1859 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1859 are further  
described hereinbelow with reference to Table 1.

[61524] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1859 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1859 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[61525] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1859 gene, herein designated VGAM is  
inhibition of expression of VGAM1859 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1859 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1859  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[61526] Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is  
a VGAM1859 host target gene. HDAC4 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12669, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61527] A function of VGAM1859 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264. High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is another VGAM1859 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9570, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61528] Another function of VGAM1859 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 duncce homolog, *Drosophila*) (PDE4D, Accession XM\_056815) is another VGAM1859 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36428, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61529] Another function of VGAM1859 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM\_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. ADMP (Accession NM\_145035) is another VGAM1859 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE,

designated SEQ ID:29655, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61530] Another function of VGAM1859 is therefore inhibition of ADMP (Accession NM\_145035). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP. DKFZP586N0721 (Accession NM\_015400) is another VGAM1859 host target gene. DKFZP586N0721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586N0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586N0721 BINDING SITE, designated SEQ ID:17710, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61531] Another function of VGAM1859 is therefore inhibition of DKFZP586N0721 (Accession NM\_015400). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586N0721. FLJ13096 (Accession NM\_025000)

is another VGAM1859 host target gene. FLJ13096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13096 BINDING SITE, designated SEQ ID:24568, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61532] Another function of VGAM1859 is therefore inhibition of FLJ13096 (Accession NM\_025000). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13096. FLJ22794 (Accession XM\_166220) is another VGAM1859 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44035, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61533] Another function of VGAM1859 is therefore inhibition of FLJ22794 (Accession XM\_166220). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA0232 (Accession XM\_052627) is another VGAM1859 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36038, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61534] Another function of VGAM1859 is therefore inhibition of KIAA0232 (Accession XM\_052627). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM\_033392) is another VGAM1859 host target gene. MAPK8IP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK8IP3, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK8IP3 BINDING SITE, designated SEQ ID:27223, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61535] Another function of VGAM1859 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 3 (MAPK8IP3, Accession NM\_033392). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP3. Testis-specific Kinase 2 (TESK2, Accession XM\_032399) is another VGAM1859 host target gene. TESK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TESK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK2 BINDING SITE, designated SEQ ID:31653, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61536] Another function of VGAM1859 is therefore inhibition of

Testis-specific Kinase 2 (TESK2, Accession XM\_032399). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSK2. LOC150225 (Accession XM\_097870) is another VGAM1859 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41194, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61537] Another function of VGAM1859 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC221814 (Accession XM\_168226) is another VGAM1859 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45094, to the nucleotide sequence of VGAM1859 RNA, herein designated VGAM RNA, also designated SEQ ID:4570.

[61538] Another function of VGAM1859 is therefore inhibition of LOC221814 (Accession XM\_168226). Accordingly, utilities of VGAM1859 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1860 (VGAM1860) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61539] VGAM1860 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1860 was detected is described hereinabove with reference to Figs. 1-8.

[61540] VGAM1860 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM1860 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[61541] VGAM1860 gene encodes a VGAM1860 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1860 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1860 precursor RNA is designated SEQ ID:1846, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1846 is located at position 9805 relative to the genome of Rice Yellow Stunt Virus.

[61542] VGAM1860 precursor RNA folds onto itself, forming VGAM1860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61543] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1860 folded precursor RNA into VGAM1860

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1860 RNA is designated SEQ ID:4571, and is provided hereinbelow with reference to the sequence listing part.

[61544] VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1860 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61545] VGAM1860 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1860 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1860 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61546] The complementary binding of VGAM1860 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1860 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1860 host target RNA into VGAM1860 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[61547] It is appreciated that VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1860 host target genes. The mRNA of each one of this plurality of VGAM1860 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1860 RNA, herein designated VGAM RNA, and which when bound by VGAM1860 RNA causes inhibition of translation of respective one or more VGAM1860 host target proteins.

[61548] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1860 gene, herein designated VGAM GENE, on one or more VGAM1860 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61549] It is yet further appreciated that a function of VGAM1860 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM1860 correlate with, and may be deduced from, the identity of the host target genes which VGAM1860 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61550] Nucleotide sequences of the VGAM1860 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1860 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1860 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1860 are further described hereinbelow with reference to Table 1.

[61551] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1860 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1860 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61552] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1860 gene, herein designated VGAM is inhibition of expression of VGAM1860 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1860 correlate with, and may be deduced from, the identity of the target genes which VGAM1860 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61553] Beta-site APP-cleaving Enzyme 2 (BACE2, Accession NM\_138992) is a VGAM1860 host target gene. BACE2 BINDING SITE1 through BACE2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE2 BINDING SITE1 through BACE2 BINDING SITE3, designated SEQ ID:29093,

SEQ ID:29091 and SEQ ID:14423 respectively, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61554] A function of VGAM1860 is therefore inhibition of Beta-site APP-cleaving Enzyme 2 (BACE2, Accession NM\_138992), a gene which cleaves intracellularly the b-secretase site of amyloid precursor protein. Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE2. The function of BACE2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM486. Sodium Channel, Nonvoltage-gated 1 Alpha (SCNN1A, Accession NM\_001038) is another VGAM1860 host target gene. SCNN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCNN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCNN1A BINDING SITE, designated SEQ ID:6703, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61555] Another function of VGAM1860 is therefore inhibition of Sodium Channel, Nonvoltage-gated 1 Alpha (SCNN1A, Accession NM\_001038). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCNN1A. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM\_031184) is another VGAM1860 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31300, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61556] Another function of VGAM1860 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM\_031184). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169) is another VGAM1860 host target gene.

SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18252, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61557] Another function of VGAM1860 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM\_016169). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM1860 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18373, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61558] Another function of VGAM1860 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. CHFR (Accession NM\_018223) is another VGAM1860 host target gene. CHFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHFR BINDING SITE, designated SEQ ID:20147, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61559] Another function of VGAM1860 is therefore inhibition of CHFR (Accession NM\_018223). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHFR. FLJ10724 (Accession NM\_018194) is another VGAM1860 host target gene. FLJ10724 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10724 BINDING SITE, designated SEQ ID:20055, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61560] Another function of VGAM1860 is therefore inhibition of FLJ10724 (Accession NM\_018194). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10724. Histamine Receptor H4 (HRH4, Accession NM\_021624) is another VGAM1860 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22264, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61561] Another function of VGAM1860 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM\_021624). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with HRH4. KIAA0152 (Accession NM\_014730) is another VGAM1860 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16333, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61562] Another function of VGAM1860 is therefore inhibition of KIAA0152 (Accession NM\_014730). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA1871 (Accession XM\_028409) is another VGAM1860 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30706, to the

nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61563] Another function of VGAM1860 is therefore inhibition of KIAA1871 (Accession XM\_028409). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. MGC32043 (Accession NM\_144582) is another VGAM1860 host target gene. MGC32043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32043 BINDING SITE, designated SEQ ID:29391, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61564] Another function of VGAM1860 is therefore inhibition of MGC32043 (Accession NM\_144582). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32043. MGC32104 (Accession NM\_144684) is another VGAM1860 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29504, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61565] Another function of VGAM1860 is therefore inhibition of MGC32104 (Accession NM\_144684). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840) is another VGAM1860 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30771, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61566] Another function of VGAM1860 is therefore inhibition of

Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. RAB1B, Member RAS Oncogene Family (RAB1B, Accession NM\_030981) is another VGAM1860 host target gene. RAB1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB1B BINDING SITE, designated SEQ ID:25245, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61567] Another function of VGAM1860 is therefore inhibition of RAB1B, Member RAS Oncogene Family (RAB1B, Accession NM\_030981). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB1B. SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM\_006937) is another VGAM1860 host target gene. SMT3H2 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by SMT3H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H2 BINDING SITE, designated SEQ ID:13820, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61568] Another function of VGAM1860 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM\_006937). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H2. TP53TG3 (Accession NM\_015369) is another VGAM1860 host target gene. TP53TG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TP53TG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53TG3 BINDING SITE, designated SEQ ID:17670, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61569] Another function of VGAM1860 is therefore inhibition of TP53TG3 (Accession NM\_015369). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53TG3. LOC158581 (Accession XM\_098968) is another VGAM1860 host target gene. LOC158581 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158581, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158581 BINDING SITE, designated SEQ ID:42016, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61570] Another function of VGAM1860 is therefore inhibition of LOC166713 (Accession XM\_106174). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166713. LOC166713 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC166713, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166713 BINDING SITE, designated SEQ ID:42196, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61571] Another function of VGAM1860 is therefore inhibition of LOC166713 (Accession XM\_106174). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166713. LOC196074 (Accession XM\_113647) is another VGAM1860 host target gene. LOC196074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196074 BINDING SITE, designated SEQ ID:42321, to the nucleotide sequence of VGAM1860 RNA, herein designated VGAM RNA, also designated SEQ ID:4571.

[61572] Another function of VGAM1860 is therefore inhibition of LOC196074 (Accession XM\_113647). Accordingly, utilities of VGAM1860 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196074. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1861 (VGAM1861) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61573] VGAM1861 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1861 was detected is described hereinabove with reference to Figs. 1–8.

[61574] VGAM1861 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rice Yellow Stunt Virus. VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61575] VGAM1861 gene encodes a VGAM1861 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1861 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1861 precursor RNA is designated SEQ ID:1847, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1847 is located at position 11283 relative to the genome of Rice Yellow Stunt Virus.

- [61576] VGAM1861 precursor RNA folds onto itself, forming VGAM1861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [61577] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1861 folded precursor RNA into VGAM1861 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1861 RNA is designated SEQ ID:4572, and is provided hereinbelow with reference to the sequence listing part.

[61578] VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1861 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61579] VGAM1861 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1861 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1861 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[61580] The complementary binding of VGAM1861 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1861 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1861 host target RNA into VGAM1861 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61581] It is appreciated that VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1861 host target genes. The mRNA of each one of this plurality of VGAM1861 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1861 RNA, herein designated VGAM RNA, and which when bound by VGAM1861 RNA causes

inhibition of translation of respective one or more VGAM1861 host target proteins.

[61582] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1861 gene, herein designated VGAM GENE, on one or more VGAM1861 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61583] It is yet further appreciated that a function of VGAM1861 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1861 include diagnosis, prevention and

treatment of viral infection by Rice Yellow Stunt Virus. Specific functions, and accordingly utilities, of VGAM1861 correlate with, and may be deduced from, the identity of the host target genes which VGAM1861 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61584] Nucleotide sequences of the VGAM1861 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1861 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1861 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1861 are further described hereinbelow with reference to Table 1.

[61585] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1861 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1861 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61586] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1861 gene, herein designated VGAM is inhibition of expression of VGAM1861 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1861 correlate with, and may be deduced from, the identity of the target genes which VGAM1861 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61587] FLJ12838 (Accession NM\_024641) is a VGAM1861 host target gene. FLJ12838 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12838 BINDING SITE, designated SEQ ID:23922, to the nucleotide sequence of VGAM1861 RNA, herein designated VGAM RNA, also designated SEQ ID:4572.

[61588] A function of VGAM1861 is therefore inhibition of FLJ12838 (Accession NM\_024641). Accordingly, utilities of VGAM1861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12838. LOC253971 (Accession XM\_171197) is another VGAM1861 host target gene. LOC253971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253971, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253971 BINDING SITE, designated SEQ ID:45986, to the nucleotide sequence of VGAM1861 RNA, herein designated VGAM RNA, also designated SEQ ID:4572.

[61589] Another function of VGAM1861 is therefore inhibition of LOC253971 (Accession XM\_171197). Accordingly, utilities of VGAM1861 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253971. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1862 (VGAM1862) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61590] VGAM1862 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1862 was detected is described hereinabove with reference to Figs. 1–8.

[61591] VGAM1862 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Lactate Dehydrogenase–elevat–

ing Virus. VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61592] VGAM1862 gene encodes a VGAM1862 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1862 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1862 precursor RNA is designated SEQ ID:1848, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1848 is located at position 5398 relative to the genome of Lactate Dehydrogenase-elevating Virus.

[61593] VGAM1862 precursor RNA folds onto itself, forming VGAM1862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61594] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1862 folded precursor RNA into VGAM1862 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1862 RNA is designated SEQ ID:4573, and is provided hereinbelow with reference to the sequence listing part.

[61595] VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1862 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61596] VGAM1862 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1862 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1862 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61597] The complementary binding of VGAM1862 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1862 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1862 host target RNA into VGAM1862 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61598] It is appreciated that VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1862 host target genes. The mRNA of each one of this plurality of VGAM1862 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1862 RNA, herein designated VGAM RNA, and which when bound by VGAM1862 RNA causes inhibition of translation of respective one or more VGAM1862 host target proteins.

[61599] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1862 gene, herein designated VGAM GENE, on one or more VGAM1862 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61600] It is yet further appreciated that a function of VGAM1862 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of viral infection by Lactate Dehydrogenase-elevating Virus. Specific functions, and accordingly utilities, of VGAM1862 correlate with, and may be deduced from, the identity of the host target genes which VGAM1862 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61601] Nucleotide sequences of the VGAM1862 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1862 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1862 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1862 are further described hereinbelow with reference to Table 1.

[61602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1862 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1862 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61603] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1862 gene, herein designated VGAM is inhibition of expression of VGAM1862 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1862 correlate with, and may be deduced from, the identity of the target genes which VGAM1862 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61604] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813) is a VGAM1862 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BIND-

ING SITE, designated SEQ ID:22382, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61605] A function of VGAM1862 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM\_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM331.C-type Lectin, Superfamily Member 12 (CLECSF12, Accession XM\_084768) is another VGAM1862 host target gene. CLECSF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE, designated SEQ ID:37686, to the nucleotide sequence of VGAM1862 RNA,

herein designated VGAM RNA, also designated SEQ ID:4573.

[61606] Another function of VGAM1862 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 12 (CLECSF12, Accession XM\_084768), a gene which is a pattern-recognition receptor . Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF12. The function of CLECSF12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM121.Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM\_033096) is another VGAM1862 host target gene. CLTCL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLTCL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLTCL1 BINDING SITE, designated SEQ ID:31839, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61607] Another function of VGAM1862 is therefore inhibition of Clathrin, Heavy Polypeptide-like 1 (CLTCL1, Accession XM\_033096), a gene which is involved in vesicle budding. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLTCL1. The function of CLTCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262) is another VGAM1862 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14572, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61608] Another function of VGAM1862 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262). Accordingly, utilities of VGAM1862 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636) is another VGAM1862 host target gene. KCNAB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB2 BINDING SITE, designated SEQ ID:9709, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61609] Another function of VGAM1862 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 2 (KCNAB2, Accession NM\_003636), a gene which is the beta subunit of shaker voltage-gated potassium channels. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB2. The function of KCNAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM659.Transcription Factor-like 4 (TCFL4, Accession XM\_032817) is another VGAM1862 host target gene. TCFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCFL4 BINDING SITE, designated SEQ ID:31771, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61610] Another function of VGAM1862 is therefore inhibition of Transcription Factor-like 4 (TCFL4, Accession XM\_032817), a gene which interacts with Mad and represses transcription by recruiting the Sin3A-histone deacetylase corepressor complex. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCFL4. The function of TCFL4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.Thyroid Hormone Receptor, Beta (erythroblastic leukemia viral (v-erb-a) Oncogene Ho-

molog 2, Avian) (THRB, Accession NM\_000461) is another VGAM1862 host target gene. THRB BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by THRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THRB BINDING SITE, designated SEQ ID:6077, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61611] Another function of VGAM1862 is therefore inhibition of Thyroid Hormone Receptor, Beta (erythroblastic leukemia viral (v-erb-a) Oncogene Homolog 2, Avian) (THRB, Accession NM\_000461). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THRB. Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316) is another VGAM1862 host target gene. TTC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TTC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TTC3 BINDING SITE, designated SEQ ID:9317, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61612] Another function of VGAM1862 is therefore inhibition of Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316), a gene which contains tetratricopeptide repeat (TPR) motifs. Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC3. The function of TTC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM699. Zinc Finger Protein 124 (HZF-16) (ZNF124, Accession NM\_003431) is another VGAM1862 host target gene. ZNF124 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF124 BINDING SITE, designated SEQ ID:9482, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61613] Another function of VGAM1862 is therefore inhibition of Zinc Finger Protein 124 (HZF-16) (ZNF124, Accession NM\_003431). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF124. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM1862 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18376, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61614] Another function of VGAM1862 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM\_031908) is another VGAM1862 host target gene. C1QTNF2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by C1QTNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF2 BINDING SITE, designated SEQ ID:25652, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61615] Another function of VGAM1862 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM\_031908). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF2. Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM\_114191) is another VGAM1862 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42773, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA,

also designated SEQ ID:4573.

[61616] Another function of VGAM1862 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM\_114191). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. Collagen, Type XII, Alpha 1 (COL12A1, Accession NM\_080645) is another VGAM1862 host target gene. COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL12A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL12A1 BINDING SITE1 and COL12A1 BINDING SITE2, designated SEQ ID:27937 and SEQ ID:10590 respectively, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61617] Another function of VGAM1862 is therefore inhibition of Collagen, Type XII, Alpha 1 (COL12A1, Accession NM\_080645). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL12A1. DKFZP667O116

(Accession XM\_168586) is another VGAM1862 host target gene. DKFZP667O116 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP667O116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP667O116 BINDING SITE, designated SEQ ID:45266, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61618] Another function of VGAM1862 is therefore inhibition of DKFZP667O116 (Accession XM\_168586). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP667O116. FLJ10687 (Accession NM\_018178) is another VGAM1862 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20011, to the nucleotide sequence of VGAM1862 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4573.

[61619] Another function of VGAM1862 is therefore inhibition of FLJ10687 (Accession NM\_018178). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ14260 (Accession NM\_025027) is another VGAM1862 host target gene. FLJ14260 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14260, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14260 BINDING SITE, designated SEQ ID:24619, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61620] Another function of VGAM1862 is therefore inhibition of FLJ14260 (Accession NM\_025027). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14260. FLJ20445 (Accession NM\_017824) is another VGAM1862 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20445, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19476, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61621] Another function of VGAM1862 is therefore inhibition of FLJ20445 (Accession NM\_017824). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445. FLJ20972 (Accession NM\_025030) is another VGAM1862 host target gene. FLJ20972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20972 BINDING SITE, designated SEQ ID:24628, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61622] Another function of VGAM1862 is therefore inhibition of FLJ20972 (Accession NM\_025030). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20972. FLJ21432 (Accession NM\_024551) is another VGAM1862 host target gene. FLJ21432 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21432 BINDING SITE, designated SEQ ID:23763, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61623] Another function of VGAM1862 is therefore inhibition of FLJ21432 (Accession NM\_024551). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21432. HU-K4 (Accession NM\_012268) is another VGAM1862 host target gene. HU-K4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HU-K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HU-K4 BINDING SITE, designated SEQ ID:14591, to the nucleotide sequence of

VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61624] Another function of VGAM1862 is therefore inhibition of HU-K4 (Accession NM\_012268). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HU-K4. HZFW1 (Accession NM\_025236) is another VGAM1862 host target gene. HZFW1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HZFW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HZFW1 BINDING SITE, designated SEQ ID:24914, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61625] Another function of VGAM1862 is therefore inhibition of HZFW1 (Accession NM\_025236). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HZFW1. KIAA0237 (Accession NM\_014747) is another VGAM1862 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16448, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61626] Another function of VGAM1862 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0322 (Accession XM\_166591) is another VGAM1862 host target gene. KIAA0322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0322 BINDING SITE, designated SEQ ID:44563, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61627] Another function of VGAM1862 is therefore inhibition of KIAA0322 (Accession XM\_166591). Accordingly, utilities

of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0322. KIAA1775 (Accession NM\_033100) is another VGAM1862 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26946, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61628] Another function of VGAM1862 is therefore inhibition of KIAA1775 (Accession NM\_033100). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. KIAA1948 (Accession XM\_091984) is another VGAM1862 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1948 BINDING SITE, designated SEQ ID:40075, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61629] Another function of VGAM1862 is therefore inhibition of KIAA1948 (Accession XM\_091984). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. Nuclear Cap Binding Protein Subunit 2, 20kDa (NCBP2, Accession NM\_007362) is another VGAM1862 host target gene. NCBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCBP2 BINDING SITE, designated SEQ ID:14294, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61630] Another function of VGAM1862 is therefore inhibition of Nuclear Cap Binding Protein Subunit 2, 20kDa (NCBP2, Accession NM\_007362). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCBP2.

PNPASE (Accession XM\_048088) is another VGAM1862 host target gene. PNPASE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNPASE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNPASE BINDING SITE, designated SEQ ID:35100, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61631] Another function of VGAM1862 is therefore inhibition of PNPASE (Accession XM\_048088). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPASE. SBBI31 (Accession NM\_014035) is another VGAM1862 host target gene. SBBI31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SBBI31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI31 BINDING SITE, designated SEQ ID:15267, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4573.

[61632] Another function of VGAM1862 is therefore inhibition of SBBI31 (Accession NM\_014035). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI31. TXI1 (Accession NM\_018430) is another VGAM1862 host target gene. TXI1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TXI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TXI1 BINDING SITE, designated SEQ ID:20493, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61633] Another function of VGAM1862 is therefore inhibition of TXI1 (Accession NM\_018430). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TXI1. Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895) is another VGAM1862 host target gene. ZNF17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF17,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF17 BINDING SITE, designated SEQ ID:40069, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61634] Another function of VGAM1862 is therefore inhibition of Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF17. LOC120114 (Accession XM\_061871) is another VGAM1862 host target gene. LOC120114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120114 BINDING SITE, designated SEQ ID:37215, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61635] Another function of VGAM1862 is therefore inhibition of

LOC120114 (Accession XM\_061871). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120114. LOC122553 (Accession XM\_058630) is another VGAM1862 host target gene. LOC122553 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122553, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122553 BINDING SITE, designated SEQ ID:36691, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61636] Another function of VGAM1862 is therefore inhibition of LOC122553 (Accession XM\_058630). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122553. LOC123242 (Accession XM\_063548) is another VGAM1862 host target gene. LOC123242 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC123242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC123242 BINDING SITE, designated SEQ ID:37246, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61637] Another function of VGAM1862 is therefore inhibition of LOC123242 (Accession XM\_063548). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123242. LOC145815 (Accession XM\_096874) is another VGAM1862 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40605, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61638] Another function of VGAM1862 is therefore inhibition of LOC145815 (Accession XM\_096874). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC149448 (Accession XM\_097642) is an-

other VGAM1862 host target gene. LOC149448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149448 BINDING SITE, designated SEQ ID:40991, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61639] Another function of VGAM1862 is therefore inhibition of LOC149448 (Accession XM\_097642). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149448. LOC153146 (Accession XM\_098319) is another VGAM1862 host target gene. LOC153146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153146 BINDING SITE, designated SEQ ID:41578, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61640] Another function of VGAM1862 is therefore inhibition of LOC153146 (Accession XM\_098319). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153146. LOC153768 (Accession NM\_138492) is another VGAM1862 host target gene. LOC153768 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153768 BINDING SITE, designated SEQ ID:28844, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61641] Another function of VGAM1862 is therefore inhibition of LOC153768 (Accession NM\_138492). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153768. LOC157627 (Accession XM\_088347) is another VGAM1862 host target gene. LOC157627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157627, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157627 BINDING SITE, designated SEQ ID:39618, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61642] Another function of VGAM1862 is therefore inhibition of LOC157627 (Accession XM\_088347). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157627. LOC196955 (Accession XM\_085210) is another VGAM1862 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37938, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61643] Another function of VGAM1862 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196955. LOC201824 (Accession XM\_114384) is another VGAM1862 host target gene. LOC201824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201824 BINDING SITE, designated SEQ ID:42920, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61644] Another function of VGAM1862 is therefore inhibition of LOC201824 (Accession XM\_114384). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201824. LOC219654 (Accession XM\_166095) is another VGAM1862 host target gene. LOC219654 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219654 BINDING SITE, designated SEQ ID:43871, to the nucleotide sequence of VGAM1862 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4573.

[61645] Another function of VGAM1862 is therefore inhibition of LOC219654 (Accession XM\_166095). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219654. LOC222803 (Accession XM\_169907) is another VGAM1862 host target gene. LOC222803 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222803 BINDING SITE, designated SEQ ID:45305, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61646] Another function of VGAM1862 is therefore inhibition of LOC222803 (Accession XM\_169907). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222803. LOC257438 (Accession XM\_168338) is another VGAM1862 host target gene. LOC257438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257438, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257438 BINDING SITE, designated SEQ ID:45109, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61647] Another function of VGAM1862 is therefore inhibition of LOC257438 (Accession XM\_168338). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257438. LOC90906 (Accession XM\_034809) is another VGAM1862 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32155, to the nucleotide sequence of VGAM1862 RNA, herein designated VGAM RNA, also designated SEQ ID:4573.

[61648] Another function of VGAM1862 is therefore inhibition of LOC90906 (Accession XM\_034809). Accordingly, utilities of VGAM1862 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC90906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1863 (VGAM1863) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61649] VGAM1863 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1863 was detected is described hereinabove with reference to Figs. 1–8.

[61650] VGAM1863 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61651] VGAM1863 gene encodes a VGAM1863 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1863 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1863 precursor RNA is desig-

nated SEQ ID:1849, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1849 is located at position 121675 relative to the genome of Callitrichine Herpesvirus 3.

- [61652] VGAM1863 precursor RNA folds onto itself, forming VGAM1863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [61653] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1863 folded precursor RNA into VGAM1863 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1863 RNA is designated SEQ ID:4574, and is provided hereinbelow with reference to the sequence

listing part.

[61654] VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1863 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61655] VGAM1863 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1863 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1863 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61656] The complementary binding of VGAM1863 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1863 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1863 host target RNA into VGAM1863 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61657] It is appreciated that VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1863 host target genes. The mRNA of each one of this plurality of VGAM1863 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1863 RNA, herein designated VGAM

RNA, and which when bound by VGAM1863 RNA causes inhibition of translation of respective one or more VGAM1863 host target proteins.

[61658] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1863 gene, herein designated VGAM GENE, on one or more VGAM1863 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61659] It is yet further appreciated that a function of VGAM1863 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1863 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1863 correlate with, and may be deduced from, the identity of the host target genes which VGAM1863 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61660] Nucleotide sequences of the VGAM1863 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1863 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1863 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1863 are further described hereinbelow with reference to Table 1.

[61661] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1863 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1863 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61662] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1863 gene, herein designated VGAM is

inhibition of expression of VGAM1863 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1863 correlate with, and may be deduced from, the identity of the target genes which VGAM1863 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61663] Asialoglycoprotein Receptor 1 (ASGR1, Accession NM\_001671) is a VGAM1863 host target gene. ASGR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ASGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASGR1 BINDING SITE, designated SEQ ID:7384, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61664] A function of VGAM1863 is therefore inhibition of Asialoglycoprotein Receptor 1 (ASGR1, Accession NM\_001671), a gene which mediates the endocytosis of plasma glycoproteins. Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASGR1. The function of ASGR1 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM1345.ATPase, Ca++ Transporting, Plasma Membrane 4 (ATP2B4, Accession XM\_046775) is another VGAM1863 host target gene. ATP2B4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP2B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2B4 BINDING SITE, designated SEQ ID:34826, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61665] Another function of VGAM1863 is therefore inhibition of ATPase, Ca++ Transporting, Plasma Membrane 4 (ATP2B4, Accession XM\_046775). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2B4. Guanine Nucleotide Binding Protein (G protein), Alpha Z Polypeptide (GNAZ, Accession NM\_002073) is another VGAM1863 host target gene. GNAZ BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNAZ, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAZ BINDING SITE, designated SEQ ID:7845, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61666] Another function of VGAM1863 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Z Polypeptide (GNAZ, Accession NM\_002073), a gene which functions as modulator or transducer in various transmembrane signaling systems. Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAZ. The function of GNAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1508. Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM\_002241) is another VGAM1863 host target gene. KCNJ10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KCNJ10 BINDING SITE, designated SEQ ID:8028, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61667] Another function of VGAM1863 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 10 (KCNJ10, Accession NM\_002241), a gene which may be responsible for potassium buffering action of glial cells in the brain. Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ10. The function of KCNJ10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM167.p21(CDKN1A)-activated Kinase 4 (PAK4, Accession NM\_005884) is another VGAM1863 host target gene. PAK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK4 BINDING SITE, designated SEQ ID:12505, to the nucleotide sequence of VGAM1863 RNA, herein

designated VGAM RNA, also designated SEQ ID:4574.

[61668] Another function of VGAM1863 is therefore inhibition of p21(CDKN1A)-activated Kinase 4 (PAK4, Accession NM\_005884). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK4. Polycystic Kidney Disease 2-like 1 (PKD2L1, Accession NM\_016112) is another VGAM1863 host target gene. PKD2L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PKD2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKD2L1 BINDING SITE, designated SEQ ID:18193, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61669] Another function of VGAM1863 is therefore inhibition of Polycystic Kidney Disease 2-like 1 (PKD2L1, Accession NM\_016112). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKD2L1. Arginine-glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102) is another VGAM1863 host target gene. RERE BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14404, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61670] Another function of VGAM1863 is therefore inhibition of Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655) is another VGAM1863 host target gene. SELL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SELL BINDING SITE, designated SEQ ID:6317, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61671] Another function of VGAM1863 is therefore inhibition of Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655), a gene which is a cell surface adhesion protein. Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELL. The function of SELL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. Snail Homolog 1 (Drosophila) (SNAI1, Accession NM\_005985) is another VGAM1863 host target gene. SNAI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAI1 BINDING SITE, designated SEQ ID:12608, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61672] Another function of VGAM1863 is therefore inhibition of Snail Homolog 1 (Drosophila) (SNAI1, Accession NM\_005985). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAI1. SRGAP2 (Accession XM\_059095) is another VGAM1863 host target gene. SRGAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRGAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRGAP2 BINDING SITE, designated SEQ ID:36878, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61673] Another function of VGAM1863 is therefore inhibition of SRGAP2 (Accession XM\_059095). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP2. Chromosome 1 Open Reading Frame 8 (C1orf8, Accession NM\_004872) is another VGAM1863 host target gene. C1orf8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

C1orf8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf8 BINDING SITE, designated SEQ ID:11300, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61674] Another function of VGAM1863 is therefore inhibition of Chromosome 1 Open Reading Frame 8 (C1orf8, Accession NM\_004872). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf8. CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779) is another VGAM1863 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT8 BINDING SITE, designated SEQ ID:11179, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61675] Another function of VGAM1863 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM\_022730) is another VGAM1863 host target gene. COPS7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COPS7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7B BINDING SITE, designated SEQ ID:22931, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61676] Another function of VGAM1863 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM\_022730). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7B. Discoidin Domain Receptor Family, Member 1 (DDR1, Accession NM\_013993) is another

VGAM1863 host target gene. DDR1 BINDING SITE1 through DDR1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDR1 BINDING SITE1 through DDR1 BINDING SITE3, designated SEQ ID:15179, SEQ ID:15181 and SEQ ID:7678 respectively, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61677] Another function of VGAM1863 is therefore inhibition of Discoidin Domain Receptor Family, Member 1 (DDR1, Accession NM\_013993). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDR1. FHX (Accession NM\_018416) is another VGAM1863 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20463,

to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61678] Another function of VGAM1863 is therefore inhibition of FHX (Accession NM\_018416). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ13241 (Accession NM\_025088) is another VGAM1863 host target gene. FLJ13241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:24710, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61679] Another function of VGAM1863 is therefore inhibition of FLJ13241 (Accession NM\_025088). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241. FLJ14107 (Accession NM\_025026) is another VGAM1863 host target gene. FLJ14107 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ14107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14107 BINDING SITE, designated SEQ ID:24617, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61680] Another function of VGAM1863 is therefore inhibition of FLJ14107 (Accession NM\_025026). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14107. FLJ22644 (Accession NM\_025098) is another VGAM1863 host target gene. FLJ22644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22644 BINDING SITE, designated SEQ ID:24741, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61681] Another function of VGAM1863 is therefore inhibition of FLJ22644 (Accession NM\_025098). Accordingly, utilities of

VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22644. HXCP2 (Accession NM\_032579) is another VGAM1863 host target gene. HXCP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HXCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HXCP2 BINDING SITE, designated SEQ ID:26313, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61682] Another function of VGAM1863 is therefore inhibition of HXCP2 (Accession NM\_032579). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HXCP2. KIAA0275 (Accession NM\_014767) is another VGAM1863 host target gene. KIAA0275 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0275 BINDING SITE,

designated SEQ ID:16551, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61683] Another function of VGAM1863 is therefore inhibition of KIAA0275 (Accession NM\_014767). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0275. KIAA0537 (Accession NM\_014840) is another VGAM1863 host target gene. KIAA0537 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0537 BINDING SITE, designated SEQ ID:16864, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61684] Another function of VGAM1863 is therefore inhibition of KIAA0537 (Accession NM\_014840). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0537. KIAA1393 (Accession XM\_050793) is another VGAM1863 host target gene. KIAA1393 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1393, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1393 BINDING SITE, designated SEQ ID:35689, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61685] Another function of VGAM1863 is therefore inhibition of KIAA1393 (Accession XM\_050793). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1393. LIECG3 (Accession XM\_113371) is another VGAM1863 host target gene. LIECG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIECG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIECG3 BINDING SITE, designated SEQ ID:42247, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61686] Another function of VGAM1863 is therefore inhibition of

LIECG3 (Accession XM\_113371). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIECG3. MGC4504 (Accession NM\_024111) is another VGAM1863 host target gene. MGC4504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4504 BINDING SITE, designated SEQ ID:23559, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61687] Another function of VGAM1863 is therefore inhibition of MGC4504 (Accession NM\_024111). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4504. PL6 (Accession NM\_007024) is another VGAM1863 host target gene. PL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PL6 BINDING SITE, designated SEQ ID:13883, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61688] Another function of VGAM1863 is therefore inhibition of PL6 (Accession NM\_007024). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PL6. Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6C (SEMA6C, Accession NM\_030913) is another VGAM1863 host target gene. SEMA6C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA6C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA6C BINDING SITE, designated SEQ ID:25183, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61689] Another function of VGAM1863 is therefore inhibition of Sema Domain, Transmembrane Domain (TM), and Cytoplasmic Domain, (semaphorin) 6C (SEMA6C, Accession

NM\_030913). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA6C. TP53TG3 (Accession NM\_015369) is another VGAM1863 host target gene. TP53TG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TP53TG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53TG3 BINDING SITE, designated SEQ ID:17672, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61690] Another function of VGAM1863 is therefore inhibition of TP53TG3 (Accession NM\_015369). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53TG3. LOC116113 (Accession XM\_166413) is another VGAM1863 host target gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44283, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61691] Another function of VGAM1863 is therefore inhibition of LOC116113 (Accession XM\_166413). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116113. LOC145757 (Accession XM\_085227) is another VGAM1863 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37970, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61692] Another function of VGAM1863 is therefore inhibition of LOC145757 (Accession XM\_085227). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC146988 (Accession XM\_097150) is an-

other VGAM1863 host target gene. LOC146988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146988 BINDING SITE, designated SEQ ID:40777, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61693] Another function of VGAM1863 is therefore inhibition of LOC146988 (Accession XM\_097150). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146988. LOC148029 (Accession XM\_086014) is another VGAM1863 host target gene. LOC148029 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148029 BINDING SITE, designated SEQ ID:38443, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61694] Another function of VGAM1863 is therefore inhibition of LOC148029 (Accession XM\_086014). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148029. LOC148114 (Accession XM\_086050) is another VGAM1863 host target gene. LOC148114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148114 BINDING SITE, designated SEQ ID:38466, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61695] Another function of VGAM1863 is therefore inhibition of LOC148114 (Accession XM\_086050). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148114. LOC157450 (Accession XM\_048209) is another VGAM1863 host target gene. LOC157450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157450, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157450 BINDING SITE, designated SEQ ID:35145, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61696] Another function of VGAM1863 is therefore inhibition of LOC157450 (Accession XM\_048209). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157450. LOC157923 (Accession XM\_088422) is another VGAM1863 host target gene. LOC157923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157923 BINDING SITE, designated SEQ ID:39684, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61697] Another function of VGAM1863 is therefore inhibition of LOC157923 (Accession XM\_088422). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157923. LOC199986 (Accession XM\_117168) is another VGAM1863 host target gene. LOC199986 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199986 BINDING SITE, designated SEQ ID:43269, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61698] Another function of VGAM1863 is therefore inhibition of LOC199986 (Accession XM\_117168). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199986. LOC203043 (Accession XM\_121734) is another VGAM1863 host target gene. LOC203043 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203043 BINDING SITE, designated SEQ ID:43615, to the nucleotide sequence of VGAM1863 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4574.

[61699] Another function of VGAM1863 is therefore inhibition of LOC203043 (Accession XM\_121734). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203043. LOC221749 (Accession XM\_166341) is another VGAM1863 host target gene. LOC221749 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221749, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221749 BINDING SITE, designated SEQ ID:44179, to the nucleotide sequence of VGAM1863 RNA, herein designated VGAM RNA, also designated SEQ ID:4574.

[61700] Another function of VGAM1863 is therefore inhibition of LOC221749 (Accession XM\_166341). Accordingly, utilities of VGAM1863 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221749. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1864 (VGAM1864) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61701] VGAM1864 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1864 was detected is described hereinabove with reference to Figs. 1–8.

[61702] VGAM1864 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61703] VGAM1864 gene encodes a VGAM1864 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1864 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1864 precursor RNA is designated SEQ ID:1850, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1850 is located at position 121062 relative to the genome of Callitrichine Herpesvirus 3.

[61704] VGAM1864 precursor RNA folds onto itself, forming

VGAM1864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61705] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1864 folded precursor RNA into VGAM1864 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1864 RNA is designated SEQ ID:4575, and is provided hereinbelow with reference to the sequence listing part.

[61706] VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1864 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61707] VGAM1864 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1864 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1864 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61708] The complementary binding of VGAM1864 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1864 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1864 host target RNA into VGAM1864 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61709] It is appreciated that VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1864 host target genes. The mRNA of each one of this plurality of VGAM1864 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1864 RNA, herein designated VGAM RNA, and which when bound by VGAM1864 RNA causes inhibition of translation of respective one or more VGAM1864 host target proteins.

[61710] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1864 gene, herein designated VGAM GENE, on one or more VGAM1864 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61711] It is yet further appreciated that a function of VGAM1864 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1864 correlate with, and may be deduced from, the identity of the host target genes which VGAM1864 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[61712] Nucleotide sequences of the VGAM1864 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1864 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1864 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1864 are further described hereinbelow with reference to Table 1.

[61713] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1864 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1864 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61714] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1864 gene, herein designated VGAM is inhibition of expression of VGAM1864 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1864 correlate with, and may be deduced from, the identity of the target genes which VGAM1864 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[61715] Adenylate Cyclase 8 (brain) (ADCY8, Accession NM\_001115) is a VGAM1864 host target gene. ADCY8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADCY8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY8 BINDING SITE, designated SEQ ID:6788, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61716] A function of VGAM1864 is therefore inhibition of Adenylate Cyclase 8 (brain) (ADCY8, Accession NM\_001115), a gene which is a membrane-bound,  $\text{Ca}^{2+}$ -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY8. The function of ADCY8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1169. AT-binding Transcription Factor 1 (ATBF1, Accession NM\_006885) is another VGAM1864 host target gene. ATBF1 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by ATBF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATBF1 BINDING SITE, designated SEQ ID:13748, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61717] Another function of VGAM1864 is therefore inhibition of AT-binding Transcription Factor 1 (ATBF1, Accession NM\_006885). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATBF1. BCL2-like 2 (BCL2L2, Accession NM\_004050) is another VGAM1864 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10262, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61718] Another function of VGAM1864 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM\_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431. Dishevelled, Dsh Homolog 1 (Drosophila) (DVL1, Accession XM\_001589) is another VGAM1864 host target gene. DVL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL1 BINDING SITE, designated SEQ ID:29842, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61719] Another function of VGAM1864 is therefore inhibition of Dishevelled, Dsh Homolog 1 (Drosophila) (DVL1, Accession XM\_001589), a gene which may play a role in the signal transduction pathway. Accordingly, utilities of

VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL1. The function of DVL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Eukaryotic Translation Initiation Factor 4E Binding Protein 2 (EIF4EBP2, Accession NM\_004096) is another VGAM1864 host target gene. EIF4EBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4EBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4EBP2 BINDING SITE, designated SEQ ID:10302, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61720] Another function of VGAM1864 is therefore inhibition of Eukaryotic Translation Initiation Factor 4E Binding Protein 2 (EIF4EBP2, Accession NM\_004096), a gene which binds EIF4E and negatively regulates initiation of translation. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4EBP2. The function of EIF4EBP2

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM501. Engrailed Homolog 2 (EN2, Accession NM\_001427) is another VGAM1864 host target gene. EN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN2 BINDING SITE, designated SEQ ID:7145, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61721] Another function of VGAM1864 is therefore inhibition of Engrailed Homolog 2 (EN2, Accession NM\_001427), a gene which may be required for normal cerebellar development; a homeobox protein, very strongly similar to murine En2. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN2. The function of EN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. G Pro-

tein-coupled Receptor 85 (GPR85, Accession NM\_018970) is another VGAM1864 host target gene. GPR85 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR85, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR85 BINDING SITE, designated SEQ ID:21043, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61722] Another function of VGAM1864 is therefore inhibition of G Protein-coupled Receptor 85 (GPR85, Accession NM\_018970). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR85. Glutathione Peroxidase 3 (plasma) (GPX3, Accession NM\_002084) is another VGAM1864 host target gene. GPX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPX3 BINDING SITE, designated SEQ ID:7879, to the nucleotide sequence of

VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61723] Another function of VGAM1864 is therefore inhibition of Glutathione Peroxidase 3 (plasma) (GPX3, Accession NM\_002084), a gene which reduces lipid hydroperoxide and H<sub>2</sub>O<sub>2</sub> in plasma. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPX3. The function of GPX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM225. High-mobility Group Box 2 (HMGB2, Accession NM\_002129) is another VGAM1864 host target gene. HMGB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HMGB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGB2 BINDING SITE, designated SEQ ID:7907, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61724] Another function of VGAM1864 is therefore inhibition of

High-mobility Group Box 2 (HMGB2, Accession NM\_002129), a gene which binds to single-stranded DNA, unwinds double-stranded DNA, and increases transcription. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGB2. The function of HMGB2 has been established by previous studies. The high mobility group (HMG) proteins are localized in the nuclei of higher eukaryotes and occur in 3 families, 1 of which includes HMG1 (OMIM Ref. No. 163905) and HMG2. These proteins include a so-called HMG box which is involved in DNA binding. Both HMG1 and HMG2 proteins bind to single-stranded DNA, unwind double-stranded DNA, and increase transcription (Wanschura et al., 1996). By screening a human genomic library with the pig thymus cDNA coding for chromosomal protein HGM2, Shirakawa and Yoshida (1992) isolated a 4,341-bp fragment containing the entire gene encoding this protein. The gene was 2,665 bp long from the start site to the end of transcription and comprised 5 exons. Length of the mRNA predicted from the exons was 1,125 bp. The canonical 5-prime regulatory motifs, CCAAT, were present, whereas the TATA element was absent from the gene. The primary structure of

the human HMG2 protein consisted of 208 amino acid residues and was different from that of the pig HGM2 in only 2 amino acids; one was exchanged and the other was missing.

[61725] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61726] Shirakawa, H.; Yoshida, M. : Structure of a gene coding for human HMG2 protein. J. Biol. Chem. 267: 6641–6645, 1992. ; and

[61727] Wanschura, S.; Schoenmakers, E. F. P. M.; Huysmans, C.; Bartnitzke, S.; Van de Ven, W. J. M.; Bullerdiek, J. : Mapping of the human HMG2 gene to 4q31. Genomics 31: 264–265, 1996.

[61728] Further studies establishing the function and utilities of HMGB2 are found in John Hopkins OMIM database record ID 163906, and in cited publications numbered 3009–3010 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol 1,4,5–trisphosphate 3–kinase B (ITPKB, Accession NM\_002221) is another VGAM1864 host target gene. ITPKB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITPKB,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:7981, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61729] Another function of VGAM1864 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM\_002221), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB. The function of ITPKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1252. Potassium Voltage-gated Channel, Isk-related Family, Member 1-like (KCNE1L, Accession NM\_012282) is another VGAM1864 host target gene. KCNE1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNE1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KCNE1L BINDING SITE, designated SEQ ID:14615, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61730] Another function of VGAM1864 is therefore inhibition of Potassium Voltage-gated Channel, Isk-related Family, Member 1-like (KCNE1L, Accession NM\_012282), a gene which is a potassium voltage-gated channel. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE1L. The function of KCNE1L has been established by previous studies. Kv4 (KCND) proteins form voltage-activated A-type potassium ion channels and are prominent in the repolarization phase of the action potential. By screening a cardiac cDNA library and RT-PCR of human ventricular RNA, Kong et al. (1998) isolated a cDNA encoding KCND3. The deduced 637-amino acid protein shares 99% sequence homology with the rat homolog. KCND3 contains 6 transmembrane segments and intracellular N- and C-termini. RT-PCR and sequence analysis demonstrated the existence of a splice variant, KCND3L, with an insert encoding an additional 19 amino acids and containing a phosphorylation site. The shorter

isoform was designated KCND3S. Zhu et al. (1999) found that the KCND3L, KCND1 (OMIM Ref. No. 300281), and KCND2 (OMIM Ref. No. 600410) proteins share 60% sequence identity and 71% homology, with the least conservation in the C terminus. By Northern blot analysis, Kong et al. (1998) detected expression of an 8.5-kb transcript that is most abundant in brain and heart and is not detectable in kidney, liver, lung, pancreas, spleen, or skeletal muscle. By the same method, Isbrandt et al. (2000) found that expression within the brain is greatest in the cerebral cortex. By RT-PCR analysis, they found that the long transcript predominates in thalamus, caudate nucleus, white matter, and epiphysis, whereas the short transcript is more abundant in frontal cortex, occipital lobe, and cerebellar cortex. Dilks et al. (1999), who cloned KCND3 from human heart and brain, found by RT-PCR that only the long form of KCND3 is expressed in heart. Isbrandt et al. (2000) determined that the long form of the KCND3 gene contains 7 exons and spans at least 25 kb. The shorter isoform is encoded by 6 exons. Kong et al. (1998) and Dilks et al. (1999) found no differences in the splice variants in terms of their voltage dependence or inactivation kinetics in the basal state. The transient outward potas-

sium current,  $I(t_o)$ , is especially important during the early phase of repolarization in many species, including human, as it sets the plateau voltage of both the atrial and the ventricular action potential. KCND2 and/or KCND3 code for the primary alpha subunits responsible for  $I(t_o)$  (Tseng, 1999). In the human ventricle, KCND3 is the gene that encodes the  $K^+$  channel that underlies  $I(t_o)$  (Dixon et al., 1996). By FISH, Kong et al. (1998) mapped the KCND3 gene to chromosome 1p13.3. By radiation hybrid mapping, Postma et al. (2000) assigned the gene to 1p13

[61731] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61732] Tseng, G.-N. : Molecular structure of cardiac  $I(t_o)$  channels: Kv4.2, Kv4.3, and other possibilities? Cardiovasc. Res. 41: 16–18, 1999. ; and

[61733] Zhu, X. R.; Wulf, A.; Schwarz, M.; Isbrandt, D.; Pongs, O. : Characterization of human Kv4.2 mediating a rapidly-inactivating transient voltage-sensitive  $K^+$  current. Receptors Channels.

[61734] Further studies establishing the function and utilities of KCNE1L are found in John Hopkins OMIM database record ID 300328, and in cited publications numbered 9151

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LPTM5 (Accession NM\_006762) is another VGAM1864 host target gene.

LPTM5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPTM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPTM5 BINDING SITE, designated SEQ ID:13616, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61735] Another function of VGAM1864 is therefore inhibition of LPTM5 (Accession NM\_006762). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPTM5. Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM\_035037) is another VGAM1864 host target gene. LRP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LRP4 BINDING SITE, designated SEQ ID:32203, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61736] Another function of VGAM1864 is therefore inhibition of Low Density Lipoprotein Receptor-related Protein 4 (LRP4, Accession XM\_035037). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP4. Neuralized-like (Drosophila) (NEURL, Accession NM\_004210) is another VGAM1864 host target gene. NEURL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEURL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:10411, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61737] Another function of VGAM1864 is therefore inhibition of Neuralized-like (Drosophila) (NEURL, Accession NM\_004210). Accordingly, utilities of VGAM1864 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL. Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM\_002531) is another VGAM1864 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8371, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61738] Another function of VGAM1864 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM\_002531), a gene which is associated with g proteins that activate a phosphatidylinositol- calcium second messenger system. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.Phosphoinositide-3-kinase, Regulatory Subunit,

Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM\_043865) is another VGAM1864 host target gene. PIK3R1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R1 BINDING SITE, designated SEQ ID:34037, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61739] Another function of VGAM1864 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 1 (p85 alpha) (PIK3R1, Accession XM\_043865), a gene which acts as an adapter, for the insulin-stimulated increase in glucose uptake and glycogen synthesis. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R1. The function of PIK3R1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM826. Placenta-specific 1 (PLAC1, Accession NM\_021796) is another VGAM1864 host target gene. PLAC1 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by PLAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC1 BINDING SITE, designated SEQ ID:22353, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61740] Another function of VGAM1864 is therefore inhibition of Placenta-specific 1 (PLAC1, Accession NM\_021796). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC1. POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM\_006237) is another VGAM1864 host target gene. POU4F1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POU4F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU4F1 BINDING SITE, designated SEQ ID:12896, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61741] Another function of VGAM1864 is therefore inhibition of POU Domain, Class 4, Transcription Factor 1 (POU4F1, Accession NM\_006237), a gene which plays a role in the regulation of specific gene expression within a subset of neuronal lineages. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POU4F1. The function of POU4F1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1026. RNA Binding Motif Protein 8A (RBM8A, Accession NM\_005105) is another VGAM1864 host target gene. RBM8A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:11580, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61742] Another function of VGAM1864 is therefore inhibition of RNA Binding Motif Protein 8A (RBM8A, Accession

NM\_005105), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A. The function of RBM8A has been established by previous studies. Mago nashi (MAGOH; 602603), meaning grandchildless, is the homolog of a *Drosophila* protein required for normal germ plasm development in fly embryos. By performing a yeast 2-hybrid screen on a fetal brain cDNA library with MAGOH as the bait, Zhao et al. (2000) recovered a cDNA encoding RBM8. The 173-amino acid RBM8 protein is more than 93% identical to the mouse and zebrafish sequences, and the mouse differences are all accounted for by an 11-amino acid N-terminal insertion and another single-residue insertion in the mouse sequence. Exchange partner and GST pull-down assays confirmed the MAGOH-RBM8 interaction and showed that RBM8 is expressed as a 26-kD protein, slightly larger than the predicted mass of 23 kD. Northern blot analysis detected a major RBM8 transcript of less than 1.0 kb in all tissues tested, with weakest expression in pancreas and brain. By searching an EST database for

homologs of the gonadotropin-releasing hormone receptor (GNRHR; 138850), followed by 5-prime RACE on a skeletal muscle cDNA library, Conklin et al. (2000) identified a cDNA encoding RBM8. Northern blot analysis detected a major 0.9-kb transcript in all tissues tested. Sequence analysis of the 174-amino acid protein predicted an RNA-binding domain, which is composed of 2 amphipathic alpha helices packed against a 4-stranded beta sheet, and a C-terminal arg-rich segment.

[61743] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61744] Conklin, D. C.; Rixon, M. W.; Kuestner, R. E.; Maurer, M. F.; Whitmore, T. E.; Millar, R. P. : Cloning and gene expression of a novel human ribonucleoprotein. *Biochim. Biophys. Acta* 1492: 465-469, 2000. ; and

[61745] Zhao, X.-F.; Nowak, N. J.; Shows, T. B.; Aplan, P. D. : MAGOH interacts with a novel RNA-binding protein. *Genomics* 63: 145-148, 2000.

[61746] Further studies establishing the function and utilities of RBM8A are found in John Hopkins OMIM database record ID 605313, and in cited publications numbered 745 and 7455-7457 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Receptor Tyrosine Kinase-like Orphan Receptor 2 (ROR2, Accession NM\_004560) is another VGAM1864 host target gene.

ROR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROR2 BINDING SITE, designated SEQ ID:10899, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61747] Another function of VGAM1864 is therefore inhibition of Receptor Tyrosine Kinase-like Orphan Receptor 2 (ROR2, Accession NM\_004560), a gene which may be involved in the early formation of the chondrocytes. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROR2. The function of ROR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628) is another VGAM1864 host target gene.

SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC1A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A5 BINDING SITE1 and SLC1A5 BINDING SITE2, designated SEQ ID:12140 and SEQ ID:38400 respectively, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61748] Another function of VGAM1864 is therefore inhibition of Solute Carrier Family 1 (neutral amino acid transporter), Member 5 (SLC1A5, Accession NM\_005628). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A5. Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM\_006359) is another VGAM1864 host target gene. SLC9A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC9A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SLC9A6 BINDING SITE, designated SEQ ID:13055, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61749] Another function of VGAM1864 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 6 (SLC9A6, Accession NM\_006359), a gene which is involved electroneutral exchange of protons for  $\text{Na}^+$  and  $\text{K}^+$  across the mitochondrial inner membrane. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A6. The function of SLC9A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM493. Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM\_031184) is another VGAM1864 host target gene. SPON1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPON1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPON1 BINDING SITE, designated SEQ ID:31301, to the nucleotide sequence of VGAM1864 RNA,

herein designated VGAM RNA, also designated SEQ ID:4575.

[61750] Another function of VGAM1864 is therefore inhibition of Spondin 1, (f-spondin) Extracellular Matrix Protein (SPON1, Accession XM\_031184). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPON1. Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM\_004613) is another VGAM1864 host target gene. TGM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGM2 BINDING SITE, designated SEQ ID:10956, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61751] Another function of VGAM1864 is therefore inhibition of Transglutaminase 2 (C polypeptide, protein-glutamine-gamma-glutamyltransferase) (TGM2, Accession NM\_004613), a gene which catalyzes the cross-linking of proteins and the conjugation of polyamines to proteins.

Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGM2. The function of TGM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM899. Vascular Endothelial Growth Factor (VEGF, Accession NM\_003376) is another VGAM1864 host target gene. VEGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VEGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEGF BINDING SITE, designated SEQ ID:9409, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61752] Another function of VGAM1864 is therefore inhibition of Vascular Endothelial Growth Factor (VEGF, Accession NM\_003376), a gene which induces endothelial cell proliferation and vascular permeability. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEGF. The function of VEGF and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Zinc Finger Protein 144 (Mel-18) (ZNF144, Accession NM\_007144) is another VGAM1864 host target gene. ZNF144 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF144 BINDING SITE, designated SEQ ID:13991, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61753] Another function of VGAM1864 is therefore inhibition of Zinc Finger Protein 144 (Mel-18) (ZNF144, Accession NM\_007144), a gene which is a transcriptional repressor and may play a role in the control of cell proliferation. Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF144. The function of ZNF144 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM380.13CDNA73

(Accession NM\_023037) is another VGAM1864 host target gene. 13CDNA73 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by 13CDNA73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 13CDNA73 BINDING SITE, designated SEQ ID:23322, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61754] Another function of VGAM1864 is therefore inhibition of 13CDNA73 (Accession NM\_023037). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 13CDNA73. UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 6 (B3GNT6, Accession NM\_006876) is another VGAM1864 host target gene. B3GNT6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B3GNT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT6 BINDING SITE, designated SEQ

ID:13745, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61755] Another function of VGAM1864 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 6 (B3GNT6, Accession NM\_006876). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT6. Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294) is another VGAM1864 host target gene. CAMKK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK1 BINDING SITE, designated SEQ ID:26069, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61756] Another function of VGAM1864 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 1, Alpha (CAMKK1, Accession NM\_032294). Accordingly,

utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK1. Claudin 4 (CLDN4, Accession NM\_001305) is another VGAM1864 host target gene. CLDN4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLDN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN4 BINDING SITE, designated SEQ ID:6987, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61757] Another function of VGAM1864 is therefore inhibition of Claudin 4 (CLDN4, Accession NM\_001305). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN4. CLIPR-59 (Accession NM\_015526) is another VGAM1864 host target gene. CLIPR-59 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIPR-59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIPR-59

BINDING SITE, designated SEQ ID:17790, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61758] Another function of VGAM1864 is therefore inhibition of CLIPR-59 (Accession NM\_015526). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59. DKFZP434C131 (Accession XM\_044630) is another VGAM1864 host target gene. DKFZP434C131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C131 BINDING SITE, designated SEQ ID:34244, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61759] Another function of VGAM1864 is therefore inhibition of DKFZP434C131 (Accession XM\_044630). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C131. DKFZP434N1511 (Accession

XM\_166138) is another VGAM1864 host target gene. DKFZP434N1511 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434N1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434N1511 BINDING SITE, designated SEQ ID:43935, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61760] Another function of VGAM1864 is therefore inhibition of DKFZP434N1511 (Accession XM\_166138). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434N1511. DKFZp547D155 (Accession XM\_046977) is another VGAM1864 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547D155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34866, to the nucleotide sequence of

VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61761] Another function of VGAM1864 is therefore inhibition of DKFZp547D155 (Accession XM\_046977). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. DKFZP727C091 (Accession XM\_038689) is another VGAM1864 host target gene. DKFZP727C091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP727C091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP727C091 BINDING SITE, designated SEQ ID:32902, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61762] Another function of VGAM1864 is therefore inhibition of DKFZP727C091 (Accession XM\_038689). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP727C091. DKFZp762P2111 (Accession XM\_098654) is another VGAM1864 host target gene. DK-

FZp762P2111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762P2111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762P2111 BINDING SITE, designated SEQ ID:41757, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61763] Another function of VGAM1864 is therefore inhibition of DKFZp762P2111 (Accession XM\_098654). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762P2111. DZIP1 (Accession NM\_014934) is another VGAM1864 host target gene. DZIP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DZIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DZIP1 BINDING SITE, designated SEQ ID:17232, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61764] Another function of VGAM1864 is therefore inhibition of DZIP1 (Accession NM\_014934). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DZIP1. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295) is another VGAM1864 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34939, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61765] Another function of VGAM1864 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. ETR101 (Accession XM\_051364) is another VGAM1864 host target gene. ETR101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ETR101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETR101 BINDING SITE, designated SEQ ID:35831, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61766] Another function of VGAM1864 is therefore inhibition of ETR101 (Accession XM\_051364). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETR101. F-box Only Protein 21 (FBXO21, Accession NM\_033624) is another VGAM1864 host target gene. FBXO21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO21 BINDING SITE, designated SEQ ID:27319, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61767] Another function of VGAM1864 is therefore inhibition of

F-box Only Protein 21 (FBXO21, Accession NM\_033624). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO21. FLJ12541 (Accession NM\_022369) is another VGAM1864 host target gene. FLJ12541 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12541 BINDING SITE, designated SEQ ID:22758, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61768] Another function of VGAM1864 is therefore inhibition of FLJ12541 (Accession NM\_022369). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12541. FLJ12816 (Accession NM\_022060) is another VGAM1864 host target gene. FLJ12816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12816 BINDING SITE, designated SEQ ID:22604, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61769] Another function of VGAM1864 is therefore inhibition of FLJ12816 (Accession NM\_022060). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12816. FLJ13189 (Accession NM\_024882) is another VGAM1864 host target gene. FLJ13189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13189 BINDING SITE, designated SEQ ID:24329, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61770] Another function of VGAM1864 is therefore inhibition of FLJ13189 (Accession NM\_024882). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ13189. FLJ14803 (Accession NM\_032842) is another VGAM1864 host target gene. FLJ14803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:26626, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61771] Another function of VGAM1864 is therefore inhibition of FLJ14803 (Accession NM\_032842). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803. FLJ20249 (Accession XM\_086573) is another VGAM1864 host target gene. FLJ20249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20249 BINDING SITE, designated SEQ ID:38773, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM

RNA, also designated SEQ ID:4575.

[61772] Another function of VGAM1864 is therefore inhibition of FLJ20249 (Accession XM\_086573). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20249. FLJ20695 (Accession NM\_017929) is another VGAM1864 host target gene. FLJ20695 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:19610, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61773] Another function of VGAM1864 is therefore inhibition of FLJ20695 (Accession NM\_017929). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695. FLJ20886 (Accession XM\_170820) is another VGAM1864 host target gene. FLJ20886 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20886, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20886 BINDING SITE, designated SEQ ID:45596, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61774] Another function of VGAM1864 is therefore inhibition of FLJ20886 (Accession XM\_170820). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20886. FLJ21313 (Accession NM\_023927) is another VGAM1864 host target gene. FLJ21313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21313 BINDING SITE, designated SEQ ID:23407, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61775] Another function of VGAM1864 is therefore inhibition of FLJ21313 (Accession NM\_023927). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ21313. FLJ23024 (Accession NM\_024936) is another VGAM1864 host target gene. FLJ23024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23024 BINDING SITE, designated SEQ ID:24473, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61776] Another function of VGAM1864 is therefore inhibition of FLJ23024 (Accession NM\_024936). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23024. FLJ23441 (Accession NM\_024678) is another VGAM1864 host target gene. FLJ23441 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23441 BINDING SITE, designated SEQ ID:23988, to the nucleotide

sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61777] Another function of VGAM1864 is therefore inhibition of FLJ23441 (Accession NM\_024678). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23441. Forkhead Box J1 (FOXJ1, Accession NM\_001454) is another VGAM1864 host target gene. FOXJ1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOXJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOXJ1 BINDING SITE, designated SEQ ID:7189, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61778] Another function of VGAM1864 is therefore inhibition of Forkhead Box J1 (FOXJ1, Accession NM\_001454). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXJ1. HYA22 (Accession NM\_005808) is another VGAM1864 host target gene. HYA22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by HYA22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYA22 BINDING SITE, designated SEQ ID:12388, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61779] Another function of VGAM1864 is therefore inhibition of HYA22 (Accession NM\_005808). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYA22. IDI2 (Accession NM\_033261) is another VGAM1864 host target gene. IDI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDI2 BINDING SITE, designated SEQ ID:27092, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61780] Another function of VGAM1864 is therefore inhibition of IDI2 (Accession NM\_033261). Accordingly, utilities of

VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDI2. Potassium Inwardly-rectifying Channel, Subfamily J, Member 9 (KCNJ9, Accession NM\_004983) is another VGAM1864 host target gene. KCNJ9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNJ9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ9 BINDING SITE, designated SEQ ID:11431, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61781] Another function of VGAM1864 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 9 (KCNJ9, Accession NM\_004983). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ9. KIAA0513 (Accession NM\_014732) is another VGAM1864 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:16363, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61782] Another function of VGAM1864 is therefore inhibition of KIAA0513 (Accession NM\_014732). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA0515 (Accession XM\_033380) is another VGAM1864 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31925, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61783] Another function of VGAM1864 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0515. KIAA0545 (Accession XM\_032278) is another VGAM1864 host target gene. KIAA0545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0545 BINDING SITE, designated SEQ ID:31637, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61784] Another function of VGAM1864 is therefore inhibition of KIAA0545 (Accession XM\_032278). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0545. KIAA0792 (Accession NM\_014698) is another VGAM1864 host target gene. KIAA0792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0792 BINDING SITE, designated SEQ ID:16214, to the nucleotide sequence of VGAM1864 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4575.

[61785] Another function of VGAM1864 is therefore inhibition of KIAA0792 (Accession NM\_014698). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0792. KIAA0937 (Accession XM\_166213) is another VGAM1864 host target gene. KIAA0937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0937 BINDING SITE, designated SEQ ID:44014, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61786] Another function of VGAM1864 is therefore inhibition of KIAA0937 (Accession XM\_166213). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0937. KIAA1126 (Accession XM\_050325) is another VGAM1864 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1126, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35606, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61787] Another function of VGAM1864 is therefore inhibition of KIAA1126 (Accession XM\_050325). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. KIAA1257 (Accession XM\_031577) is another VGAM1864 host target gene. KIAA1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE, designated SEQ ID:31435, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61788] Another function of VGAM1864 is therefore inhibition of KIAA1257 (Accession XM\_031577). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1257. KIAA1363 (Accession XM\_045056) is another VGAM1864 host target gene. KIAA1363 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1363, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1363 BINDING SITE, designated SEQ ID:34333, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61789] Another function of VGAM1864 is therefore inhibition of KIAA1363 (Accession XM\_045056). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1363. KIAA1377 (Accession XM\_040708) is another VGAM1864 host target gene. KIAA1377 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1377, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1377 BINDING SITE, designated SEQ ID:33360, to the

nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61790] Another function of VGAM1864 is therefore inhibition of KIAA1377 (Accession XM\_040708). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1377. KIAA1509 (Accession XM\_029353) is another VGAM1864 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30874, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61791] Another function of VGAM1864 is therefore inhibition of KIAA1509 (Accession XM\_029353). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. KIAA1750 (Accession XM\_043067) is another VGAM1864 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33876, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61792] Another function of VGAM1864 is therefore inhibition of KIAA1750 (Accession XM\_043067). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. LIM and SH3 Protein 1 (LASP1, Accession NM\_006148) is another VGAM1864 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12800, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61793] Another function of VGAM1864 is therefore inhibition of

LIM and SH3 Protein 1 (LASP1, Accession NM\_006148). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. Leiomodlin 1 (smooth muscle) (LMOD1, Accession NM\_012134) is another VGAM1864 host target gene. LMOD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LMOD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMOD1 BINDING SITE, designated SEQ ID:14446, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61794] Another function of VGAM1864 is therefore inhibition of Leiomodlin 1 (smooth muscle) (LMOD1, Accession NM\_012134). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMOD1. Mitogen-activated Protein Kinase 13 (MAPK13, Accession NM\_002754) is another VGAM1864 host target gene. MAPK13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK13, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK13 BINDING SITE, designated SEQ ID:8632, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61795] Another function of VGAM1864 is therefore inhibition of Mitogen-activated Protein Kinase 13 (MAPK13, Accession NM\_002754). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK13. MEP50 (Accession NM\_024102) is another VGAM1864 host target gene. MEP50 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEP50, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEP50 BINDING SITE, designated SEQ ID:23546, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61796] Another function of VGAM1864 is therefore inhibition of MEP50 (Accession NM\_024102). Accordingly, utilities of

VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEP50. PDEF (Accession NM\_012391) is another VGAM1864 host target gene. PDEF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDEF BINDING SITE, designated SEQ ID:14747, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61797] Another function of VGAM1864 is therefore inhibition of PDEF (Accession NM\_012391). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDEF. PHD Finger Protein 7 (PHF7, Accession NM\_016483) is another VGAM1864 host target gene. PHF7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PHF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHF7 BINDING

SITE, designated SEQ ID:18581, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61798] Another function of VGAM1864 is therefore inhibition of PHD Finger Protein 7 (PHF7, Accession NM\_016483). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHF7. PPI5PIV (Accession NM\_019892) is another VGAM1864 host target gene. PPI5PIV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPI5PIV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPI5PIV BINDING SITE, designated SEQ ID:21275, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61799] Another function of VGAM1864 is therefore inhibition of PPI5PIV (Accession NM\_019892). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPI5PIV. Protease, Serine, 25 (PRSS25, Accession NM\_013247) is another VGAM1864 host target gene. PRSS25 BINDING

SITE1 and PRSS25 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PRSS25, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSS25 BINDING SITE1 and PRSS25 BINDING SITE2, designated SEQ ID:14908 and SEQ ID:29707 respectively, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61800] Another function of VGAM1864 is therefore inhibition of Protease, Serine, 25 (PRSS25, Accession NM\_013247). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS25. SARM (Accession NM\_015077) is another VGAM1864 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17454, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA,

also designated SEQ ID:4575.

[61801] Another function of VGAM1864 is therefore inhibition of SARM (Accession NM\_015077). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM1864 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16080, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61802] Another function of VGAM1864 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC3. SKIP (Accession NM\_016532) is another VGAM1864 host target gene. SKIP BINDING SITE1 and SKIP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

SKIP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIP BINDING SITE1 and SKIP BINDING SITE2, designated SEQ ID:18596 and SEQ ID:28259 respectively, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61803] Another function of VGAM1864 is therefore inhibition of SKIP (Accession NM\_016532). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIP. TED (Accession NM\_015686) is another VGAM1864 host target gene. TED BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TED, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TED BINDING SITE, designated SEQ ID:17912, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61804] Another function of VGAM1864 is therefore inhibition of TED (Accession NM\_015686). Accordingly, utilities of

VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TED. Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM\_014820) is another VGAM1864 host target gene. TOMM70A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM70A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM70A BINDING SITE, designated SEQ ID:16792, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61805] Another function of VGAM1864 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 70 Homolog A (yeast) (TOMM70A, Accession NM\_014820). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM70A. Zinc Finger Protein 313 (ZNF313, Accession NM\_018683) is another VGAM1864 host target gene. ZNF313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF313, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF313 BINDING SITE, designated SEQ ID:20753, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61806] Another function of VGAM1864 is therefore inhibition of Zinc Finger Protein 313 (ZNF313, Accession NM\_018683). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF313. LOC124044 (Accession XM\_071871) is another VGAM1864 host target gene. LOC124044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124044 BINDING SITE, designated SEQ ID:37432, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61807] Another function of VGAM1864 is therefore inhibition of LOC124044 (Accession XM\_071871). Accordingly, utilities

of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124044. LOC124997 (Accession XM\_058886) is another VGAM1864 host target gene. LOC124997 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC124997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124997 BINDING SITE, designated SEQ ID:36786, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61808] Another function of VGAM1864 is therefore inhibition of LOC124997 (Accession XM\_058886). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124997. LOC126006 (Accession XM\_058956) is another VGAM1864 host target gene. LOC126006 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC126006 BINDING SITE, designated SEQ ID:36801, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61809] Another function of VGAM1864 is therefore inhibition of LOC126006 (Accession XM\_058956). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126006. LOC130813 (Accession XM\_065904) is another VGAM1864 host target gene. LOC130813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130813 BINDING SITE, designated SEQ ID:37312, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61810] Another function of VGAM1864 is therefore inhibition of LOC130813 (Accession XM\_065904). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130813. LOC145371 (Accession XM\_085123) is another VGAM1864 host target gene. LOC145371 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145371 BINDING SITE, designated SEQ ID:37841, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61811] Another function of VGAM1864 is therefore inhibition of LOC145371 (Accession XM\_085123). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145371. LOC145438 (Accession XM\_096781) is another VGAM1864 host target gene. LOC145438 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145438 BINDING SITE, designated SEQ ID:40535, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61812] Another function of VGAM1864 is therefore inhibition of

LOC145438 (Accession XM\_096781). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145438. LOC146728 (Accession XM\_097074) is another VGAM1864 host target gene. LOC146728 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146728 BINDING SITE, designated SEQ ID:40724, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61813] Another function of VGAM1864 is therefore inhibition of LOC146728 (Accession XM\_097074). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146728. LOC148397 (Accession XM\_086171) is another VGAM1864 host target gene. LOC148397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC148397 BINDING SITE, designated SEQ ID:38526, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61814] Another function of VGAM1864 is therefore inhibition of LOC148397 (Accession XM\_086171). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148397. LOC149171 (Accession XM\_086450) is another VGAM1864 host target gene. LOC149171 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149171 BINDING SITE, designated SEQ ID:38667, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61815] Another function of VGAM1864 is therefore inhibition of LOC149171 (Accession XM\_086450). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149171. LOC149706 (Accession XM\_097718) is an-

other VGAM1864 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41058, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61816] Another function of VGAM1864 is therefore inhibition of LOC149706 (Accession XM\_097718). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149706. LOC152805 (Accession XM\_087526) is another VGAM1864 host target gene. LOC152805 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152805 BINDING SITE, designated SEQ ID:39323, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61817] Another function of VGAM1864 is therefore inhibition of LOC152805 (Accession XM\_087526). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152805. LOC153577 (Accession XM\_098394) is another VGAM1864 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41646, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61818] Another function of VGAM1864 is therefore inhibition of LOC153577 (Accession XM\_098394). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC157349 (Accession XM\_088298) is another VGAM1864 host target gene. LOC157349 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157349, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157349 BINDING SITE, designated SEQ ID:39598, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61819] Another function of VGAM1864 is therefore inhibition of LOC157349 (Accession XM\_088298). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157349. LOC157858 (Accession XM\_098833) is another VGAM1864 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:41865, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61820] Another function of VGAM1864 is therefore inhibition of LOC157858 (Accession XM\_098833). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC157858. LOC164382 (Accession XM\_104390) is another VGAM1864 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42160, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61821] Another function of VGAM1864 is therefore inhibition of LOC164382 (Accession XM\_104390). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. LOC166042 (Accession XM\_093623) is another VGAM1864 host target gene. LOC166042 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC166042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC166042 BINDING SITE, designated SEQ ID:40200, to the nucleotide sequence of VGAM1864 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4575.

[61822] Another function of VGAM1864 is therefore inhibition of LOC166042 (Accession XM\_093623). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC166042. LOC196707 (Accession XM\_113616) is another VGAM1864 host target gene. LOC196707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196707 BINDING SITE, designated SEQ ID:42297, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61823] Another function of VGAM1864 is therefore inhibition of LOC196707 (Accession XM\_113616). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196707. LOC199923 (Accession XM\_114057) is another VGAM1864 host target gene. LOC199923 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199923, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199923 BINDING SITE, designated SEQ ID:42670, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61824] Another function of VGAM1864 is therefore inhibition of LOC199923 (Accession XM\_114057). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199923. LOC200470 (Accession XM\_117235) is another VGAM1864 host target gene. LOC200470 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200470 BINDING SITE, designated SEQ ID:43306, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61825] Another function of VGAM1864 is therefore inhibition of LOC200470 (Accession XM\_117235). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC200470. LOC201617 (Accession XM\_117315) is another VGAM1864 host target gene. LOC201617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201617 BINDING SITE, designated SEQ ID:43380, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61826] Another function of VGAM1864 is therefore inhibition of LOC201617 (Accession XM\_117315). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201617. LOC202126 (Accession XM\_117362) is another VGAM1864 host target gene. LOC202126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202126 BINDING SITE, designated SEQ ID:43410, to

the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61827] Another function of VGAM1864 is therefore inhibition of LOC202126 (Accession XM\_117362). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202126. LOC203504 (Accession XM\_117550) is another VGAM1864 host target gene. LOC203504 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203504 BINDING SITE, designated SEQ ID:43572, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61828] Another function of VGAM1864 is therefore inhibition of LOC203504 (Accession XM\_117550). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203504. LOC204161 (Accession XM\_118480) is another VGAM1864 host target gene. LOC204161 BINDING SITE1 and LOC204161 BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by LOC204161, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204161 BINDING SITE1 and LOC204161 BINDING SITE2, designated SEQ ID:43579 and SEQ ID:43580 respectively, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61829] Another function of VGAM1864 is therefore inhibition of LOC204161 (Accession XM\_118480). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204161. LOC221463 (Accession XM\_166374) is another VGAM1864 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44199, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61830] Another function of VGAM1864 is therefore inhibition of LOC221463 (Accession XM\_166374). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC221490 (Accession XM\_168084) is another VGAM1864 host target gene. LOC221490 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221490, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221490 BINDING SITE, designated SEQ ID:44987, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61831] Another function of VGAM1864 is therefore inhibition of LOC221490 (Accession XM\_168084). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221490. LOC253675 (Accession XM\_172990) is another VGAM1864 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46263, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61832] Another function of VGAM1864 is therefore inhibition of LOC253675 (Accession XM\_172990). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. LOC253891 (Accession XM\_170485) is another VGAM1864 host target gene. LOC253891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253891 BINDING SITE, designated SEQ ID:45323, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61833] Another function of VGAM1864 is therefore inhibition of LOC253891 (Accession XM\_170485). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253891. LOC254228 (Accession XM\_171123) is another VGAM1864 host target gene. LOC254228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254228 BINDING SITE, designated SEQ ID:45920, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61834] Another function of VGAM1864 is therefore inhibition of LOC254228 (Accession XM\_171123). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254228. LOC255189 (Accession XM\_172929) is another VGAM1864 host target gene. LOC255189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255189 BINDING SITE, designated SEQ ID:46194, to the nucleotide sequence of VGAM1864 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4575.

[61835] Another function of VGAM1864 is therefore inhibition of LOC255189 (Accession XM\_172929). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255189. LOC256502 (Accession XM\_170546) is another VGAM1864 host target gene. LOC256502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256502 BINDING SITE, designated SEQ ID:45367, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61836] Another function of VGAM1864 is therefore inhibition of LOC256502 (Accession XM\_170546). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256502. LOC256581 (Accession XM\_174399) is another VGAM1864 host target gene. LOC256581 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256581, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256581 BINDING SITE, designated SEQ ID:46591, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61837] Another function of VGAM1864 is therefore inhibition of LOC256581 (Accession XM\_174399). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256581. LOC257447 (Accession XM\_096847) is another VGAM1864 host target gene. LOC257447 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257447 BINDING SITE, designated SEQ ID:40568, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61838] Another function of VGAM1864 is therefore inhibition of LOC257447 (Accession XM\_096847). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257447. LOC51152 (Accession NM\_016181) is another VGAM1864 host target gene. LOC51152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51152 BINDING SITE, designated SEQ ID:18284, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61839] Another function of VGAM1864 is therefore inhibition of LOC51152 (Accession NM\_016181). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51152. LOC90141 (Accession XM\_029373) is another VGAM1864 host target gene. LOC90141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90141 BINDING SITE, designated SEQ ID:30880, to the

nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61840] Another function of VGAM1864 is therefore inhibition of LOC90141 (Accession XM\_029373). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90141. LOC92568 (Accession XM\_045852) is another VGAM1864 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34579, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61841] Another function of VGAM1864 is therefore inhibition of LOC92568 (Accession XM\_045852). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. LOC93268 (Accession XM\_050158) is another VGAM1864 host target gene. LOC93268 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC93268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93268 BINDING SITE, designated SEQ ID:35588, to the nucleotide sequence of VGAM1864 RNA, herein designated VGAM RNA, also designated SEQ ID:4575.

[61842] Another function of VGAM1864 is therefore inhibition of LOC93268 (Accession XM\_050158). Accordingly, utilities of VGAM1864 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1865 (VGAM1865) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61843] VGAM1865 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1865 was detected is described hereinabove with reference to Figs. 1-8.

[61844] VGAM1865 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Callitrichine Herpesvirus 3. VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61845] VGAM1865 gene encodes a VGAM1865 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1865 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1865 precursor RNA is designated SEQ ID:1851, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1851 is located at position 122877 relative to the genome of Callitrichine Herpesvirus 3.

[61846] VGAM1865 precursor RNA folds onto itself, forming VGAM1865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61847] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1865 folded precursor RNA into VGAM1865 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1865 RNA is designated SEQ ID:4576, and is provided hereinbelow with reference to the sequence listing part.

[61848] VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1865 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61849] VGAM1865 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1865 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1865 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61850] The complementary binding of VGAM1865 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1865 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1865

host target RNA into VGAM1865 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61851] It is appreciated that VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1865 host target genes. The mRNA of each one of this plurality of VGAM1865 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1865 RNA, herein designated VGAM RNA, and which when bound by VGAM1865 RNA causes inhibition of translation of respective one or more VGAM1865 host target proteins.

[61852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1865 gene, herein designated VGAM GENE, on one or more VGAM1865 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61853] It is yet further appreciated that a function of VGAM1865 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1865 correlate with, and may be deduced from, the identity of the host target genes which VGAM1865 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61854] Nucleotide sequences of the VGAM1865 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1865 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1865 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1865 are further

described hereinbelow with reference to Table 1.

[61855] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1865 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1865 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61856] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1865 gene, herein designated VGAM is inhibition of expression of VGAM1865 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1865 correlate with, and may be deduced from, the identity of the target genes which VGAM1865 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61857] E2F Transcription Factor 3 (E2F3, Accession NM\_001949) is a VGAM1865 host target gene. E2F3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F3 BINDING

SITE, designated SEQ ID:7665, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61858] A function of VGAM1865 is therefore inhibition of E2F Transcription Factor 3 (E2F3, Accession NM\_001949), a gene which binds dna and controls cell-cycle progression from g1 to s phase. Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F3. The function of E2F3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM\_002836) is another VGAM1865 host target gene. PTPRA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PTPRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRA BINDING SITE, designated SEQ ID:8714, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61859] Another function of VGAM1865 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM\_002836), a gene which is the human homolog of the murine PTPase. Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRA. The function of PTPRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205.SH3-domain GRB2-like 1 (SH3GL1, Accession NM\_003025) is another VGAM1865 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:8964, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61860] Another function of VGAM1865 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession NM\_003025). Accordingly, utilities of VGAM1865 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038) is another VGAM1865 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8993, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61861] Another function of VGAM1865 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038), a gene which transports alanine, serine, cysteine, and threonine. exhibits sodium dependence. Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM859.Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM\_007256) is another VGAM1865 host target gene. SLC21A9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A9 BINDING SITE, designated SEQ ID:14125, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61862] Another function of VGAM1865 is therefore inhibition of Solute Carrier Family 21 (organic anion transporter), Member 9 (SLC21A9, Accession NM\_007256), a gene which is Moderately similar to SLC21A2 prostaglandin transporter. Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A9. The function of SLC21A9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM894.Tumor Necrosis Factor, Alpha-induced Protein

2 (TNFAIP2, Accession NM\_006291) is another VGAM1865 host target gene. TNFAIP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFAIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP2 BINDING SITE, designated SEQ ID:12982, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61863] Another function of VGAM1865 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 2 (TNFAIP2, Accession NM\_006291). Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP2. C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911) is another VGAM1865 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE,

designated SEQ ID:25661, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61864] Another function of VGAM1865 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911). Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. KIAA1979 (Accession XM\_113984) is another VGAM1865 host target gene. KIAA1979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1979 BINDING SITE, designated SEQ ID:42591, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61865] Another function of VGAM1865 is therefore inhibition of KIAA1979 (Accession XM\_113984). Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1979. STAF65(gamma) (Accession NM\_014860) is

another VGAM1865 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:16926, to the nucleotide sequence of VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61866] Another function of VGAM1865 is therefore inhibition of STAF65(gamma) (Accession NM\_014860). Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). LOC146856 (Accession XM\_096086) is another VGAM1865 host target gene. LOC146856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146856 BINDING SITE, designated SEQ ID:40298, to the nucleotide sequence of

VGAM1865 RNA, herein designated VGAM RNA, also designated SEQ ID:4576.

[61867] Another function of VGAM1865 is therefore inhibition of LOC146856 (Accession XM\_096086). Accordingly, utilities of VGAM1865 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146856. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1866 (VGAM1866) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61868] VGAM1866 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1866 was detected is described hereinabove with reference to Figs. 1–8.

[61869] VGAM1866 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61870] VGAM1866 gene encodes a VGAM1866 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1866 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1866 precursor RNA is designated SEQ ID:1852, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1852 is located at position 121344 relative to the genome of Callitrichine Herpesvirus 3.

[61871] VGAM1866 precursor RNA folds onto itself, forming VGAM1866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61872] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1866 folded precursor RNA into VGAM1866 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1866 RNA is designated SEQ ID:4577, and is provided hereinbelow with reference to the sequence listing part.

[61873] VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1866 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61874] VGAM1866 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1866 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1866 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61875] The complementary binding of VGAM1866 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1866 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1866 host target RNA into VGAM1866 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61876] It is appreciated that VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1866 host target genes. The mRNA of each one of this plurality of VGAM1866 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1866 RNA, herein designated VGAM RNA, and which when bound by VGAM1866 RNA causes inhibition of translation of respective one or more VGAM1866 host target proteins.

[61877] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1866 gene, herein designated VGAM GENE, on one or more VGAM1866 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[61878] It is yet further appreciated that a function of VGAM1866 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1866 correlate with, and may be deduced from, the identity of the host target genes which VGAM1866 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61879] Nucleotide sequences of the VGAM1866 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1866 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1866 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1866 are further described hereinbelow with reference to Table 1.

[61880] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1866 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1866 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61881] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1866 gene, herein designated VGAM is inhibition of expression of VGAM1866 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1866 correlate with, and may be deduced from, the identity of the target genes which VGAM1866 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61882] BRF1 Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM\_001519) is a VGAM1866 host target gene. BRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRF1 BINDING SITE, designated SEQ ID:7254, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61883] A function of VGAM1866 is therefore inhibition of BRF1

Homolog, Subunit of RNA Polymerase III Transcription Initiation Factor IIIB (*S. cerevisiae*) (BRF1, Accession NM\_001519), a gene which is a general activator of RNA polymerase III. Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRF1. The function of BRF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. HERV-H LTR-associating 1 (HHLA1, Accession NM\_005712) is another VGAM1866 host target gene. HHLA1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HHLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA1 BINDING SITE, designated SEQ ID:12264, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61884] Another function of VGAM1866 is therefore inhibition of HERV-H LTR-associating 1 (HHLA1, Accession NM\_005712), a gene which has unknown function and with low similarity to a region of *S. cerevisiae* WSC4. Ac-

cordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA1. The function of HHLA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM158. Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM\_002507) is another VGAM1866 host target gene. NGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE, designated SEQ ID:8333, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61885] Another function of VGAM1866 is therefore inhibition of Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM\_002507), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR and its asso-

ciation with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM212. Protein Tyrosine Phosphatase, Non-receptor Type 18 (brain-derived) (PTPN18, Accession NM\_014369) is another VGAM1866 host target gene. PTPN18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPN18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN18 BINDING SITE, designated SEQ ID:15702, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61886] Another function of VGAM1866 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 18 (brain-derived) (PTPN18, Accession NM\_014369). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN18. Vitamin D (1,25-dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376) is another VGAM1866 host target gene. VDR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by VDR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDR BINDING SITE, designated SEQ ID:5942, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61887] Another function of VGAM1866 is therefore inhibition of Vitamin D (1,25- dihydroxyvitamin D3) Receptor (VDR, Accession NM\_000376). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDR. A2BP1 (Accession NM\_018723) is another VGAM1866 host target gene. A2BP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by A2BP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of A2BP1 BINDING SITE, designated SEQ ID:20802, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61888] Another function of VGAM1866 is therefore inhibition of

A2BP1 (Accession NM\_018723). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with A2BP1. Bromodomain Containing 4 (BRD4, Accession NM\_058243) is another VGAM1866 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:27773, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61889] Another function of VGAM1866 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM\_058243). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. DKFZP564B1162 (Accession NM\_031305) is another VGAM1866 host target gene. DKFZP564B1162 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564B1162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B1162 BINDING SITE, designated SEQ ID:25336, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61890] Another function of VGAM1866 is therefore inhibition of DKFZP564B1162 (Accession NM\_031305). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B1162. KIAA1607 (Accession XM\_033379) is another VGAM1866 host target gene. KIAA1607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1607 BINDING SITE, designated SEQ ID:31913, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61891] Another function of VGAM1866 is therefore inhibition of KIAA1607 (Accession XM\_033379). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1607. KIAA1987 (Accession XM\_113870) is another VGAM1866 host target gene. KIAA1987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1987 BINDING SITE, designated SEQ ID:42491, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61892] Another function of VGAM1866 is therefore inhibition of KIAA1987 (Accession XM\_113870). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1987. LOC116113 (Accession XM\_166413) is another VGAM1866 host target gene. LOC116113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116113 BINDING SITE, designated SEQ ID:44282, to the nucleotide sequence of VGAM1866 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4577.

[61893] Another function of VGAM1866 is therefore inhibition of LOC116113 (Accession XM\_166413). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116113. LOC162333 (Accession XM\_102591) is another VGAM1866 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42132, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61894] Another function of VGAM1866 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC221495 (Accession XM\_168136) is another VGAM1866 host target gene. LOC221495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221495, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221495 BINDING SITE, designated SEQ ID:45055, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61895] Another function of VGAM1866 is therefore inhibition of LOC221495 (Accession XM\_168136). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221495. LOC257479 (Accession XM\_171548) is another VGAM1866 host target gene. LOC257479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257479 BINDING SITE, designated SEQ ID:46053, to the nucleotide sequence of VGAM1866 RNA, herein designated VGAM RNA, also designated SEQ ID:4577.

[61896] Another function of VGAM1866 is therefore inhibition of LOC257479 (Accession XM\_171548). Accordingly, utilities of VGAM1866 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC257479. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1867 (VGAM1867) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61897] VGAM1867 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1867 was detected is described hereinabove with reference to Figs. 1–8.

[61898] VGAM1867 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61899] VGAM1867 gene encodes a VGAM1867 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1867 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1867 precursor RNA is desig-

nated SEQ ID:1853, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1853 is located at position 121561 relative to the genome of Callitrichine Herpesvirus 3.

- [61900] VGAM1867 precursor RNA folds onto itself, forming VGAM1867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [61901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1867 folded precursor RNA into VGAM1867 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1867 RNA is designated SEQ ID:4578, and is provided hereinbelow with reference to the sequence

listing part.

[61902] VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1867 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61903] VGAM1867 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1867 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1867 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61904] The complementary binding of VGAM1867 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1867 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1867 host target RNA into VGAM1867 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61905] It is appreciated that VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1867 host target genes. The mRNA of each one of this plurality of VGAM1867 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1867 RNA, herein designated VGAM

RNA, and which when bound by VGAM1867 RNA causes inhibition of translation of respective one or more VGAM1867 host target proteins.

[61906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1867 gene, herein designated VGAM GENE, on one or more VGAM1867 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61907] It is yet further appreciated that a function of VGAM1867 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1867 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1867 correlate with, and may be deduced from, the identity of the host target genes which VGAM1867 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61908] Nucleotide sequences of the VGAM1867 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1867 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1867 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1867 are further described hereinbelow with reference to Table 1.

[61909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1867 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1867 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1867 gene, herein designated VGAM is

inhibition of expression of VGAM1867 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1867 correlate with, and may be deduced from, the identity of the target genes which VGAM1867 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61911] Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000646) is a VGAM1867 host target gene. AGL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGL BINDING SITE, designated SEQ ID:6301, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61912] A function of VGAM1867 is therefore inhibition of Amylo-1, 6-glucosidase, 4-alpha-glucanotransferase (glycogen debranching enzyme, glycogen storage disease type III) (AGL, Accession NM\_000646). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGL.

Ras Homolog Gene Family, Member C (ARHC, Accession NM\_005167) is another VGAM1867 host target gene. ARHC BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHC BINDING SITE, designated SEQ ID:11661, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61913] Another function of VGAM1867 is therefore inhibition of Ras Homolog Gene Family, Member C (ARHC, Accession NM\_005167), a gene which remodels of the actin cytoskeleton during cell morphogenesis and motility. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHC. The function of ARHC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885.Deleted In Azoospermia-like (DAZL, Accession XM\_042839) is another VGAM1867 host target gene. DAZL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by DAZL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZL BINDING SITE, designated SEQ ID:33797, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61914] Another function of VGAM1867 is therefore inhibition of Deleted In Azoospermia-like (DAZL, Accession XM\_042839), a gene which may be essential for gametogenesis. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZL. The function of DAZL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206.FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM\_006732) is another VGAM1867 host target gene. FOSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of FOSB BINDING SITE, designated SEQ ID:13579, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61915] Another function of VGAM1867 is therefore inhibition of FBJ Murine Osteosarcoma Viral Oncogene Homolog B (FOSB, Accession NM\_006732), a gene which interacts with jun proteins enhancing their dna binding activity. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOSB. The function of FOSB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM747.3-hydroxy-3-methylglutaryl-Coenzyme A Reductase (HMGCR, Accession NM\_000859) is another VGAM1867 host target gene. HMGCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGCR BINDING SITE, designated SEQ ID:6521, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM

RNA, also designated SEQ ID:4578.

[61916] Another function of VGAM1867 is therefore inhibition of 3-hydroxy-3-methylglutaryl-Coenzyme A Reductase (HMGCR, Accession NM\_000859), a gene which is involved in the control of cholesterol biosynthesis and is the rate-limiting enzyme of sterol biosynthesis. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGCR. The function of HMGCR has been established by previous studies. Although catalyzing a rate-limiting step in cholesterol biosynthesis (see OMIM Ref. No. 143890) is the best known role of HMG-CoA reductase, the enzyme also participates in the production of a wide variety of other compounds. Some clinical benefits attributed to inhibitors of HMG-CoA reductase appear to be independent of any serum cholesterol-lowering effect. Van Doren et al. (1998) described a new cholesterol-independent role for the enzyme, in regulating a developmental process, primordial germ cell migration. They showed that in *Drosophila* this enzyme is highly expressed in the somatic gonad and that it is necessary for primordial germ cells to migrate to this tissue. Misexpression of HMG-CoA reductase was sufficient to attract pri-

mordial germ cells to tissues other than the gonadal mesoderm. Van Doren et al. (1998) concluded that the regulated expression of HMG-CoA reductase has a critical developmental function in providing spatial information to guide migrating primordial germ cells. Istvan and Deisenhofer (2001) determined structures of the catalytic portion of human HMG-CoA reductase complexed with 6 different statins. The statins occupy a portion of the binding site of HMG-CoA, thus blocking access of this substrate to the active site. Near the carboxyl terminus of HMG-CoA reductase, several catalytically relevant residues are disordered in the enzyme-statin complexes. If these residues were not flexible, they would sterically hinder statin binding.

[61917] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61918] Van Doren, M.; Broihier, H. T.; Moore, L. A.; Lehmann, R. : HMG-CoA reductase guides migrating primordial germ cells. *Nature* 396: 466-469, 1998. ; and

[61919] Istvan, E. S.; Deisenhofer, J. : Structural mechanism for statin inhibition of HMG-CoA reductase. *Science* 292: 1160-1164, 2001.

[61920] Further studies establishing the function and utilities of HMGCR are found in John Hopkins OMIM database record ID 142910, and in cited publications numbered 11712–11713, 359 and 3614–3618 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM\_011181) is another VGAM1867 host target gene. LRAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:30181, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61921] Another function of VGAM1867 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM\_011181). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. Myotubularin Related Protein 8 (MTMR8, Accession

NM\_015458) is another VGAM1867 host target gene.

MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17742, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61922] Another function of VGAM1867 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Neurocalcin Delta (NCALD, Accession NM\_032041) is another VGAM1867 host target gene. NCALD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

NCALD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCALD BINDING SITE, designated SEQ ID:25742, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61923] Another function of VGAM1867 is therefore inhibition of Neurocalcin Delta (NCALD, Accession NM\_032041). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCALD. PACE (Accession NM\_002569) is another VGAM1867 host target gene. PACE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACE BINDING SITE, designated SEQ ID:8421, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61924] Another function of VGAM1867 is therefore inhibition of PACE (Accession NM\_002569), a gene which processes

pro-parathyroid hormone, pro-transforming growth factor beta. Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACE. The function of PACE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM151. Protein Tyrosine Phosphatase, Non-receptor Type 7 (PTPN7, Accession NM\_002832) is another VGAM1867 host target gene. PTPN7 BINDING SITE1 through PTPN7 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPN7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN7 BINDING SITE1 through PTPN7 BINDING SITE3, designated SEQ ID:8708, SEQ ID:27886 and SEQ ID:27889 respectively, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61925] Another function of VGAM1867 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 7 (PTPN7, Accession NM\_002832). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PTPN7. DKFZp434F054 (Accession NM\_032259) is another VGAM1867 host target gene. DKFZp434F054 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434F054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F054 BINDING SITE, designated SEQ ID:26002, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61926] Another function of VGAM1867 is therefore inhibition of DKFZp434F054 (Accession NM\_032259). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F054. FACTP140 (Accession NM\_007192) is another VGAM1867 host target gene. FACTP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FACTP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FACTP140 BINDING SITE, designated SEQ ID:14045, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61927] Another function of VGAM1867 is therefore inhibition of FACTP140 (Accession NM\_007192). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACTP140. FLJ11099 (Accession NM\_018320) is another VGAM1867 host target gene. FLJ11099 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11099, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11099 BINDING SITE, designated SEQ ID:20312, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61928] Another function of VGAM1867 is therefore inhibition of FLJ11099 (Accession NM\_018320). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11099. FLJ20436 (Accession NM\_017822) is another VGAM1867 host target gene. FLJ20436 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20436 BINDING SITE, designated SEQ ID:19474, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61929] Another function of VGAM1867 is therefore inhibition of FLJ20436 (Accession NM\_017822). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20436. FLJ21977 (Accession NM\_032213) is another VGAM1867 host target gene. FLJ21977 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21977 BINDING SITE, designated SEQ ID:25938, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61930] Another function of VGAM1867 is therefore inhibition of

FLJ21977 (Accession NM\_032213). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21977. HCA127 (Accession NM\_018684) is another VGAM1867 host target gene. HCA127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA127 BINDING SITE, designated SEQ ID:20758, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61931] Another function of VGAM1867 is therefore inhibition of HCA127 (Accession NM\_018684). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA127. KIAA0493 (Accession XM\_034717) is another VGAM1867 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:32141, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61932] Another function of VGAM1867 is therefore inhibition of KIAA0493 (Accession XM\_034717). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0618 (Accession NM\_014833) is another VGAM1867 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16838, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61933] Another function of VGAM1867 is therefore inhibition of KIAA0618 (Accession NM\_014833). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. MGC20235 (Accession NM\_145041) is another

VGAM1867 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29667, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61934] Another function of VGAM1867 is therefore inhibition of MGC20235 (Accession NM\_145041). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. MGC23280 (Accession NM\_144683) is another VGAM1867 host target gene. MGC23280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC23280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23280 BINDING SITE, designated SEQ ID:29500, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61935] Another function of VGAM1867 is therefore inhibition of MGC23280 (Accession NM\_144683). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23280. MGC4771 (Accession NM\_032668) is another VGAM1867 host target gene. MGC4771 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4771, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4771 BINDING SITE, designated SEQ ID:26395, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61936] Another function of VGAM1867 is therefore inhibition of MGC4771 (Accession NM\_032668). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4771. MGC5149 (Accession XM\_051200) is another VGAM1867 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:35781, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61937] Another function of VGAM1867 is therefore inhibition of MGC5149 (Accession XM\_051200). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149. poly(rC) Binding Protein 4 (PCBP4, Accession NM\_033008) is another VGAM1867 host target gene. PCBP4 BINDING SITE1 through PCBP4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCBP4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCBP4 BINDING SITE1 through PCBP4 BINDING SITE3, designated SEQ ID:26893, SEQ ID:26895 and SEQ ID:21677 respectively, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61938] Another function of VGAM1867 is therefore inhibition of poly(rC) Binding Protein 4 (PCBP4, Accession NM\_033008).

Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCBP4. LOC129566 (Accession XM\_065294) is another VGAM1867 host target gene. LOC129566 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC129566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129566 BINDING SITE, designated SEQ ID:37278, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61939] Another function of VGAM1867 is therefore inhibition of LOC129566 (Accession XM\_065294). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129566. LOC130595 (Accession XM\_065793) is another VGAM1867 host target gene. LOC130595 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC130595, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC130595 BINDING SITE, designated SEQ ID:37298, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61940] Another function of VGAM1867 is therefore inhibition of LOC130595 (Accession XM\_065793). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130595. LOC143286 (Accession XM\_096412) is another VGAM1867 host target gene. LOC143286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143286 BINDING SITE, designated SEQ ID:40352, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61941] Another function of VGAM1867 is therefore inhibition of LOC143286 (Accession XM\_096412). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143286. LOC144438 (Accession XM\_084860) is an-

other VGAM1867 host target gene. LOC144438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144438 BINDING SITE, designated SEQ ID:37733, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61942] Another function of VGAM1867 is therefore inhibition of LOC144438 (Accession XM\_084860). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144438. LOC147077 (Accession XM\_085699) is another VGAM1867 host target gene. LOC147077 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147077 BINDING SITE, designated SEQ ID:38289, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61943] Another function of VGAM1867 is therefore inhibition of LOC147077 (Accession XM\_085699). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147077. LOC152765 (Accession XM\_087519) is another VGAM1867 host target gene. LOC152765 BINDING SITE1 and LOC152765 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC152765, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE1 and LOC152765 BINDING SITE2, designated SEQ ID:39309 and SEQ ID:39310 respectively, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61944] Another function of VGAM1867 is therefore inhibition of LOC152765 (Accession XM\_087519). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC153577 (Accession XM\_098394) is another VGAM1867 host target gene. LOC153577 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC153577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153577 BINDING SITE, designated SEQ ID:41642, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61945] Another function of VGAM1867 is therefore inhibition of LOC153577 (Accession XM\_098394). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153577. LOC90936 (Accession XM\_034953) is another VGAM1867 host target gene. LOC90936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90936 BINDING SITE, designated SEQ ID:32189, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61946] Another function of VGAM1867 is therefore inhibition of LOC90936 (Accession XM\_034953). Accordingly, utilities

of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90936. LOC92218 (Accession XM\_043647) is another VGAM1867 host target gene. LOC92218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92218 BINDING SITE, designated SEQ ID:33986, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61947] Another function of VGAM1867 is therefore inhibition of LOC92218 (Accession XM\_043647). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92218. LOC92305 (Accession NM\_138385) is another VGAM1867 host target gene. LOC92305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC92305 BINDING SITE, designated SEQ ID:28757, to the nucleotide sequence of VGAM1867 RNA, herein designated VGAM RNA, also designated SEQ ID:4578.

[61948] Another function of VGAM1867 is therefore inhibition of LOC92305 (Accession NM\_138385). Accordingly, utilities of VGAM1867 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92305. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1868 (VGAM1868) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61949] VGAM1868 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1868 was detected is described hereinabove with reference to Figs. 1–8.

[61950] VGAM1868 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Callitrichine Herpesvirus 3. VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61951] VGAM1868 gene encodes a VGAM1868 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1868 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1868 precursor RNA is designated SEQ ID:1854, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1854 is located at position 119545 relative to the genome of Callitrichine Herpesvirus 3.

[61952] VGAM1868 precursor RNA folds onto itself, forming VGAM1868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61953] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1868 folded precursor RNA into VGAM1868 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1868 RNA is designated SEQ ID:4579, and is provided hereinbelow with reference to the sequence listing part.

[61954] VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1868 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61955] VGAM1868 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1868 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1868 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61956] The complementary binding of VGAM1868 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1868 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1868 host target RNA into VGAM1868 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61957] It is appreciated that VGAM1868 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1868 host target genes. The mRNA of each one of this plurality of VGAM1868 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1868 RNA, herein designated VGAM RNA, and which when bound by VGAM1868 RNA causes inhibition of translation of respective one or more VGAM1868 host target proteins.

[61958] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1868 gene, herein designated VGAM GENE, on one or more VGAM1868 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[61959] It is yet further appreciated that a function of VGAM1868 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of viral infection by Callitrichine Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1868 correlate with, and may be deduced from, the identity of the host target genes which VGAM1868 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61960] Nucleotide sequences of the VGAM1868 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1868 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1868 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1868 are further described hereinbelow with reference to Table 1.

[61961] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1868 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1868 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61962] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1868 gene, herein designated VGAM is inhibition of expression of VGAM1868 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1868 correlate with, and may be deduced from, the identity of the target genes which VGAM1868 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61963] V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163) is a VGAM1868 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BINDING SITE, designated SEQ ID:11653, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61964] A function of VGAM1868 is therefore inhibition of V-akt

Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163), a gene which Serine-threonine protein kinase. Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM188.Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053) is another VGAM1868 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:33000, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61965] Another function of VGAM1868 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM1868 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359. Protocadherin Beta 9 (PCDHB9, Accession NM\_019119) is another VGAM1868 host target gene. PCDHB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB9 BINDING SITE, designated SEQ ID:21204, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61966] Another function of VGAM1868 is therefore inhibition of Protocadherin Beta 9 (PCDHB9, Accession NM\_019119), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB9. The function of PCDHB9 and its association with various diseases and

clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Sialyltransferase 8E (alpha-2, 8-polysialyltransferase) (SIAT8E, Accession XM\_008705) is another VGAM1868 host target gene. SIAT8E BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SIAT8E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8E BINDING SITE, designated SEQ ID:30089, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61967] Another function of VGAM1868 is therefore inhibition of Sialyltransferase 8E (alpha-2, 8-polysialyltransferase) (SIAT8E, Accession XM\_008705). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8E. TNF Receptor-associated Factor 1 (TRAF1, Accession NM\_005658) is another VGAM1868 host target gene. TRAF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRAF1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF1 BINDING SITE, designated SEQ ID:12197, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61968] Another function of VGAM1868 is therefore inhibition of TNF Receptor-associated Factor 1 (TRAF1, Accession NM\_005658), a gene which signal transducer associated with the cytoplasmic domain of the 75 kda tumor necrosis factor receptor (tnf-r2). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF1. The function of TRAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250.DKFZP434G1411 (Accession XM\_166383) is another VGAM1868 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:44230, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61969] Another function of VGAM1868 is therefore inhibition of DKFZP434G1411 (Accession XM\_166383). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. FLJ10956 (Accession NM\_018283) is another VGAM1868 host target gene. FLJ10956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10956 BINDING SITE, designated SEQ ID:20276, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61970] Another function of VGAM1868 is therefore inhibition of FLJ10956 (Accession NM\_018283). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10956. FLJ12787 (Accession NM\_032175) is another

VGAM1868 host target gene. FLJ12787 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12787, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12787 BINDING SITE, designated SEQ ID:25889, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61971] Another function of VGAM1868 is therefore inhibition of FLJ12787 (Accession NM\_032175). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12787. Oxysterol Binding Protein-like 11 (OSBPL11, Accession NM\_022776) is another VGAM1868 host target gene. OSBPL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL11 BINDING SITE, designated SEQ ID:23045, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ

ID:4579.

[61972] Another function of VGAM1868 is therefore inhibition of Oxysterol Binding Protein-like 11 (OSBPL11, Accession NM\_022776). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL11. PSR (Accession XM\_036784) is another VGAM1868 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32495, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61973] Another function of VGAM1868 is therefore inhibition of PSR (Accession XM\_036784). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. RA-GEF-2 (Accession NM\_016340) is another VGAM1868 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RA-GEF-2, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18460, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61974] Another function of VGAM1868 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. LOC149401 (Accession XM\_086511) is another VGAM1868 host target gene. LOC149401 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149401 BINDING SITE, designated SEQ ID:38735, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61975] Another function of VGAM1868 is therefore inhibition of LOC149401 (Accession XM\_086511). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149401. LOC157860 (Accession XM\_098832) is another VGAM1868 host target gene. LOC157860 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157860 BINDING SITE, designated SEQ ID:41860, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61976] Another function of VGAM1868 is therefore inhibition of LOC157860 (Accession XM\_098832). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157860. LOC158927 (Accession XM\_099004) is another VGAM1868 host target gene. LOC158927 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158927 BINDING SITE, designated SEQ ID:42040, to

the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61977] Another function of VGAM1868 is therefore inhibition of LOC158927 (Accession XM\_099004). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158927. LOC165552 (Accession XM\_092666) is another VGAM1868 host target gene. LOC165552 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165552, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165552 BINDING SITE, designated SEQ ID:40132, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61978] Another function of VGAM1868 is therefore inhibition of LOC165552 (Accession XM\_092666). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165552. LOC92370 (Accession XM\_044665) is another VGAM1868 host target gene. LOC92370 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC92370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92370 BINDING SITE, designated SEQ ID:34258, to the nucleotide sequence of VGAM1868 RNA, herein designated VGAM RNA, also designated SEQ ID:4579.

[61979] Another function of VGAM1868 is therefore inhibition of LOC92370 (Accession XM\_044665). Accordingly, utilities of VGAM1868 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92370. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1869 (VGAM1869) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[61980] VGAM1869 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1869 was detected is described hereinabove with reference to Figs. 1-8.

[61981] VGAM1869 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine Herpesvirus 2. VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[61982] VGAM1869 gene encodes a VGAM1869 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1869 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1869 precursor RNA is designated SEQ ID:1855, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1855 is located at position 125161 relative to the genome of Equine Herpesvirus 2.

[61983] VGAM1869 precursor RNA folds onto itself, forming VGAM1869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[61984] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1869 folded precursor RNA into VGAM1869 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1869 RNA is designated SEQ ID:4580, and is provided hereinbelow with reference to the sequence listing part.

[61985] VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1869 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[61986] VGAM1869 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1869 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1869 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[61987] The complementary binding of VGAM1869 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1869 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1869

host target RNA into VGAM1869 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[61988] It is appreciated that VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1869 host target genes. The mRNA of each one of this plurality of VGAM1869 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1869 RNA, herein designated VGAM RNA, and which when bound by VGAM1869 RNA causes inhibition of translation of respective one or more VGAM1869 host target proteins.

[61989] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1869 gene, herein designated VGAM GENE, on one or more VGAM1869 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[61990] It is yet further appreciated that a function of VGAM1869 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1869 correlate with, and may be deduced from, the identity of the host target genes which VGAM1869 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[61991] Nucleotide sequences of the VGAM1869 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1869 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1869 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1869 are further

described hereinbelow with reference to Table 1.

[61992] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1869 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1869 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[61993] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1869 gene, herein designated VGAM is inhibition of expression of VGAM1869 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1869 correlate with, and may be deduced from, the identity of the target genes which VGAM1869 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[61994] CDP-diacylglycerol Synthase (phosphatidate cytidylyl-transferase) 2 (CDS2, Accession NM\_003818) is a VGAM1869 host target gene. CDS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of CDS2 BINDING SITE, designated SEQ ID:9908, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[61995] A function of VGAM1869 is therefore inhibition of CDP-diacylglycerol Synthase (phosphatidate cytidylyltransferase) 2 (CDS2, Accession NM\_003818), a gene which is a key regulator of the amount of PIP2 available for signaling. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDS2. The function of CDS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM900. Dysferlin, Limb Girdle Muscular Dystrophy 2B (autosomal recessive) (DYSF, Accession NM\_003494) is another VGAM1869 host target gene. DYSF BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DYSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYSF BINDING SITE, designated SEQ ID:9585, to the nucleotide sequence of VGAM1869 RNA, herein

designated VGAM RNA, also designated SEQ ID:4580.

[61996] Another function of VGAM1869 is therefore inhibition of Dysferlin, Limb Girdle Muscular Dystrophy 2B (autosomal recessive) (DYSF, Accession NM\_003494), a gene which is highly expressed in skeletal muscle. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYSF. The function of DYSF has been established by previous studies. The limb-girdle muscular dystrophies are a genetically heterogeneous group of inherited progressive muscular disorders that affect mainly the proximal musculature, with evidence for at least 3 autosomal dominant and 8 autosomal recessive loci. The recessive forms for the most part involve mutations in genes encoding components of the dystrophin-associated complex; another form, LGMD2A (OMIM Ref. No. 253600), is caused by mutations in the gene for the muscle-specific protease calpain 3 (CAPN3; 114340). Miyoshi myopathy (MM; 254130) is an adult-onset, recessively inherited distal muscular dystrophy that maps to 2p13. A form of recessive limb-girdle muscular dystrophy, designated LGMD2B (OMIM Ref. No. 253601), maps to the same chromosomal region. This raised the possibility that MM and LGMD2B are allelic

disorders. In fact they were shown to be varying expressions of the same mutant gene; 2 large, inbred kindreds whose members included both MM and LGMD2B patients were described by Weiler et al. (1996) and Illarioshkin et al. (1996, 1997). Affected individuals in both pedigrees shared the same haplotype. Differences in the phenotype appeared to be due to additional modifying factors. Liu et al. (1998) constructed a 3-Mb PAC contig spanning the MM candidate region. This clarified the order of genetic markers across the area, provided 5 new polymorphic markers within it, and narrowed the locus to approximately 2 Mb. They found 5 skeletal muscle ESTs that mapped in this region. Liu et al. (1998) reported that 1 of these ESTs is located in a novel, full-length 6.9-kb muscle cDNA; they designated the corresponding protein dysferlin. Animal model experiments lend further support to the function of DYSF. The SJL mouse strain (Festing, 1979) is susceptible to many induced autoimmune diseases such as experimental autoimmune encephalitis (EAE) and inflammatory muscle disease. Additionally, the skeletal muscle of SJL mice was shown to have an increased regenerative capacity and demonstrates the spontaneous occurrence of what was designated an 'inflammatory my-

opathy,' accompanied by loss of strength. By histopathologic examinations of muscles in SJL mice of different ages, Bittner et al. (1999) found features compatible with a progressive muscular dystrophy, including degenerative and regenerative changes of muscle fibers and a progressive fibrosis. Histologically, the changes were observed in mice as young as 3 weeks of age. Changes affected primarily the proximal muscle groups, whereas the distal muscles remained less affected. The morphologic alterations were associated with signs of slowly progressive muscle weakness, which Bittner et al. (1999) detected as early as 3 weeks after birth when mice were suspended by their tails. The phenotype was found to be inherited as an autosomal recessive trait and was found to map to mouse chromosome 6, in a region syntenic with human 2p13, where the DYSF gene maps. Because of this synteny, Bittner et al. (1999) studied dysferlin in these mice. They found a reduction to approximately 15% of control levels in SJL mice. They found a 171-bp deletion in the *Dysf* gene of SJL mice, predicted to result in removal of 57 amino acids, including most of the fourth C2 domain. The last C2 domain is conserved in other members of the ferlike gene family.

[61997] It is appreciated that the abovementioned animal model for DYSF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[61998] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[61999] Bittner, R. E.; Anderson, L. V. B.; Burkhardt, E.; Bashir, R.; Vafiadaki, E.; Ivanova, S.; Raffelsberger, T.; Maerk, I.; Hoger, H.; Jung, M.; Karbasiyan, M.; Storch, M.; Lassmann, H.; Moss, J. A.; Davison, K.; Harrison, R.; Bushby, K. M. D.; Reis, A. : Dysferlin deletion in SJL mice (SJL-Dysf) defines a natural model for limb girdle muscular dystrophy 2B. (Letter) Nature Genet. 23: 141–142, 1999. ; and

[62000] Liu, J.; Wu, C.; Bossie, K.; Bejaoui, K.; Hosler, B. A.; Gingrich, J. C.; Ben Hamida, M.; Hentati, F.; Schurr, E.; de Jong, P. J.; Brown, R. H., Jr. : Generation of 3-Mb PAC contig sp.

[62001] Further studies establishing the function and utilities of DYSF are found in John Hopkins OMIM database record ID 603009, and in cited publications numbered 5879, 7234, 7754–7756, 6425, 6427, 7235, 7757–7758, 947 and 7759 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference. Fibroblast Growth Factor 18 (FGF18, Accession NM\_003862) is another VGAM1869 host target gene. FGF18 BINDING SITE1 and FGF18 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGF18, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF18 BINDING SITE1 and FGF18 BINDING SITE2, designated SEQ ID:9955 and SEQ ID:27383 respectively, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62002] Another function of VGAM1869 is therefore inhibition of Fibroblast Growth Factor 18 (FGF18, Accession NM\_003862), a gene which stimulates hepatic and intestinal proliferation. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF18. The function of FGF18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM925.LENG4 (Accession NM\_024298) is another

VGAM1869 host target gene. LENG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LENG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LENG4 BINDING SITE, designated SEQ ID:23585, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62003] Another function of VGAM1869 is therefore inhibition of LENG4 (Accession NM\_024298), a gene which may be a transmembrane protein. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LENG4. The function of LENG4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.V-yes-1 Yamaguchi Sarcoma Viral Related Oncogene Homolog (LYN, Accession NM\_002350) is another VGAM1869 host target gene. LYN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LYN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LYN BINDING SITE, designated SEQ ID:8153, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62004] Another function of VGAM1869 is therefore inhibition of V–yes–1 Yamaguchi Sarcoma Viral Related Oncogene Homolog (LYN, Accession NM\_002350), a gene which is a Tyrosine kinase with similarity to murine tyrosine kinase p56lck; similar to v–yes protein and the gene products of v–fgr and v–src. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LYN. The function of LYN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Matrix Metalloproteinase 25 (MMP25, Accession NM\_022468) is another VGAM1869 host target gene. MMP25 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MMP25 BINDING SITE, designated SEQ ID:22822, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62005] Another function of VGAM1869 is therefore inhibition of Matrix Metalloproteinase 25 (MMP25, Accession NM\_022468). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP25. Phospholipase A2, Group X (PLA2G10, Accession NM\_003561) is another VGAM1869 host target gene. PLA2G10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLA2G10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G10 BINDING SITE, designated SEQ ID:9619, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62006] Another function of VGAM1869 is therefore inhibition of Phospholipase A2, Group X (PLA2G10, Accession NM\_003561). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G10. Scratch Homolog

1, Zinc Finger Protein (Drosophila) (SCRT1, Accession NM\_031309) is another VGAM1869 host target gene. SCRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCRT1 BINDING SITE, designated SEQ ID:25346, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62007] Another function of VGAM1869 is therefore inhibition of Scratch Homolog 1, Zinc Finger Protein (Drosophila) (SCRT1, Accession NM\_031309), a gene which is involved in the generation and migration of neural crest cells. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCRT1. The function of SCRT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM\_007163) is another VGAM1869 host target gene.

SLC14A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC14A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:14011, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62008] Another function of VGAM1869 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM\_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Survival of Motor Neuron 1, Telomeric (SMN1, Accession NM\_022874) is another VGAM1869 host target gene. SMN1 BINDING SITE1 and SMN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMN1, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMN1 BINDING SITE1 and SMN1 BINDING SITE2, designated SEQ ID:23151 and SEQ ID:5895 respectively, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62009] Another function of VGAM1869 is therefore inhibition of Survival of Motor Neuron 1, Telomeric (SMN1, Accession NM\_022874), a gene which plays an essential role in spliceosomal snrnp assembly in the cytoplasm. Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMN1. The function of SMN1 has been established by previous studies. Lefebvre et al. (1995) described an inverted duplication of a 500-kb element in normal chromosome 5q13 which contains the gene for spinal muscular atrophy, e.g., type I (SMA1; 253300). They further narrowed the critical region to 140 kb within the telomeric portion of this region. This interval was found to contain a 20-kb gene encoding a novel protein of 294 amino acids. A highly homologous gene (SMN2; 601627), referred to as C-BCD541, was present in the duplicated

centromeric element in 95% of controls. The authors suggested that the defect in SMA resides in the telomeric gene, which they found was either lacking or interrupted in 226 of 229 patients. The other 3 patients retaining the gene carried either a point mutation (Y272C; 600354.0004) or short deletions in the consensus splice sites of introns 6 and 7. The gene, designated SMN for survival motor neuron gene, was found to have no homology at either the nucleotide or the amino acid level to sequences in several databases. The SMN gene has 8 exons. SMN interacts with spliceosomal snRNP proteins and is critical for snRNP assembly in the cytoplasm. Pellizzoni et al. (1998) demonstrated that a dominant-negative mutant SMN lacking the first amino-terminal 27 amino acids (SMN $\Delta$ elN27) causes a dramatic reorganization of snRNPs in the nucleus. Furthermore, SMN $\Delta$ elN27 inhibits pre-mRNA splicing in vitro, while wildtype SMN stimulates splicing (using chicken delta-crystallin mRNA as the experimental system). SMN mutants found in SMA patients cannot stimulate splicing. These findings demonstrate that SMN plays a crucial role in the generation of the pre-mRNA splicing machinery and thus in mRNA biogenesis. Animal model experiments lend further support to the

function of SMN1. To understand the functional role of SMN1 in spinal muscular atrophy, Hsieh-Li et al. (2000) produced mouse lines deficient for mouse Smn and transgenic mouse lines that expressed human SMN2. Smn -/- mice died during the peri-implantation stage. In contrast, transgenic mice harboring SMN2 in the Smn -/- background showed pathologic changes in the spinal cord and skeletal muscles similar to those of SMA patients. The severity of the pathologic changes in these mice correlated with the amount of SMN protein that contained the region encoded by exon 7. The results demonstrated that SMN2 can partially compensate for lack of SMN1. The variable phenotypes of Smn -/-SMN2 mice reflected those seen in SMA patients, thus providing a mouse model for that disease.

[62010] It is appreciated that the abovementioned animal model for SMN1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[62011] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[62012] Lefebvre, S.; Burglen, L.; Reboullet, S.; Clermont, O.;

[62014] Further studies establishing the function and utilities of SMN1 are found in John Hopkins OMIM database record ID 600354, and in cited publications numbered 8364, 9829-8371, 9237, 9879-9885, 9238, 9886-9888, 9239, 9889-9893, 9240, 9894-9902, 10138, 10160-10172, 673 and 10173 listed in the bibliography section herein-below, which are also hereby incorporated by reference. Centaurin, Beta 5 (CENTB5, Accession XM\_170937) is another VGAM1869 host target gene. CENTB5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTB5 BINDING SITE, designated SEQ ID:45724, to the

nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62015] Another function of VGAM1869 is therefore inhibition of Centaurin, Beta 5 (CENTB5, Accession XM\_170937). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTB5. DKFZP434F0318 (Accession NM\_030817) is another VGAM1869 host target gene. DKFZP434F0318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434F0318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F0318 BINDING SITE, designated SEQ ID:25142, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62016] Another function of VGAM1869 is therefore inhibition of DKFZP434F0318 (Accession NM\_030817). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F0318. DKFZp761O0113 (Accession NM\_018409) is another VGAM1869 host target gene. DK-

FZp761O0113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp761O0113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761O0113 BINDING SITE, designated SEQ ID:20447, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62017] Another function of VGAM1869 is therefore inhibition of DKFZp761O0113 (Accession NM\_018409). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761O0113. FLJ10297 (Accession NM\_018049) is another VGAM1869 host target gene. FLJ10297 BINDING SITE1 and FLJ10297 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10297, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10297 BINDING SITE1 and FLJ10297 BINDING SITE2, designated SEQ ID:19804 and SEQ ID:19806 respectively, to the nucleotide sequence of

VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62018] Another function of VGAM1869 is therefore inhibition of FLJ10297 (Accession NM\_018049). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10297. FLJ12387 (Accession NM\_022822) is another VGAM1869 host target gene. FLJ12387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12387 BINDING SITE, designated SEQ ID:23102, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62019] Another function of VGAM1869 is therefore inhibition of FLJ12387 (Accession NM\_022822). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12387. FLJ12581 (Accession NM\_024865) is another VGAM1869 host target gene. FLJ12581 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ12581, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12581 BINDING SITE, designated SEQ ID:24301, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62020] Another function of VGAM1869 is therefore inhibition of FLJ12581 (Accession NM\_024865). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12581. FLJ14810 (Accession NM\_032843) is another VGAM1869 host target gene. FLJ14810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14810 BINDING SITE, designated SEQ ID:26636, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62021] Another function of VGAM1869 is therefore inhibition of FLJ14810 (Accession NM\_032843). Accordingly, utilities of

VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14810. FLJ14834 (Accession NM\_032849) is another VGAM1869 host target gene. FLJ14834 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14834, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14834 BINDING SITE, designated SEQ ID:26643, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62022] Another function of VGAM1869 is therefore inhibition of FLJ14834 (Accession NM\_032849). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14834. FLJ21032 (Accession NM\_024906) is another VGAM1869 host target gene. FLJ21032 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ21032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21032

BINDING SITE, designated SEQ ID:24397, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62023] Another function of VGAM1869 is therefore inhibition of FLJ21032 (Accession NM\_024906). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21032. FLJ22479 (Accession NM\_024900) is another VGAM1869 host target gene. FLJ22479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22479 BINDING SITE, designated SEQ ID:24385, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62024] Another function of VGAM1869 is therefore inhibition of FLJ22479 (Accession NM\_024900). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22479. HCA4 (Accession XM\_085287) is another VGAM1869 host target gene. HCA4 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38023, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62025] Another function of VGAM1869 is therefore inhibition of HCA4 (Accession XM\_085287). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA0089 (Accession XM\_046056) is another VGAM1869 host target gene. KIAA0089 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0089, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0089 BINDING SITE, designated SEQ ID:34665, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62026] Another function of VGAM1869 is therefore inhibition of

KIAA0089 (Accession XM\_046056). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0089. KIAA0557 (Accession XM\_085507) is another VGAM1869 host target gene. KIAA0557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0557 BINDING SITE, designated SEQ ID:38208, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62027] Another function of VGAM1869 is therefore inhibition of KIAA0557 (Accession XM\_085507). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0557. KIAA1210 (Accession XM\_172801) is another VGAM1869 host target gene. KIAA1210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:46087, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62028] Another function of VGAM1869 is therefore inhibition of KIAA1210 (Accession XM\_172801). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210. KIAA1668 (Accession XM\_039236) is another VGAM1869 host target gene. KIAA1668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1668 BINDING SITE, designated SEQ ID:33028, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62029] Another function of VGAM1869 is therefore inhibition of KIAA1668 (Accession XM\_039236). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1668. SARM (Accession NM\_015077) is another

VGAM1869 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17462, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62030] Another function of VGAM1869 is therefore inhibition of SARM (Accession NM\_015077). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. SNFT (Accession NM\_018664) is another VGAM1869 host target gene. SNFT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNFT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNFT BINDING SITE, designated SEQ ID:20743, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62031] Another function of VGAM1869 is therefore inhibition of SNFT (Accession NM\_018664). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNFT. Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM\_055929) is another VGAM1869 host target gene. UHRF2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by UHRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF2 BINDING SITE, designated SEQ ID:36356, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62032] Another function of VGAM1869 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 2 (UHRF2, Accession XM\_055929). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF2. LOC134121 (Accession XM\_059692) is another VGAM1869 host target gene. LOC134121 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC134121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134121 BINDING SITE, designated SEQ ID:37063, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62033] Another function of VGAM1869 is therefore inhibition of LOC134121 (Accession XM\_059692). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134121. LOC150630 (Accession XM\_097931) is another VGAM1869 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41241, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62034] Another function of VGAM1869 is therefore inhibition of LOC150630 (Accession XM\_097931). Accordingly, utilities

of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC155382 (Accession XM\_098713) is another VGAM1869 host target gene. LOC155382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155382 BINDING SITE, designated SEQ ID:41765, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62035] Another function of VGAM1869 is therefore inhibition of LOC155382 (Accession XM\_098713). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155382. LOC203369 (Accession XM\_114689) is another VGAM1869 host target gene. LOC203369 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC203369 BINDING SITE, designated SEQ ID:43032, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62036] Another function of VGAM1869 is therefore inhibition of LOC203369 (Accession XM\_114689). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203369. LOC203427 (Accession XM\_114699) is another VGAM1869 host target gene. LOC203427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203427 BINDING SITE, designated SEQ ID:43044, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62037] Another function of VGAM1869 is therefore inhibition of LOC203427 (Accession XM\_114699). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203427. LOC221431 (Accession XM\_166380) is another VGAM1869 host target gene. LOC221431 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44224, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62038] Another function of VGAM1869 is therefore inhibition of LOC221431 (Accession XM\_166380). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC254057 (Accession XM\_173085) is another VGAM1869 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46343, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62039] Another function of VGAM1869 is therefore inhibition of

LOC254057 (Accession XM\_173085). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC257486 (Accession XM\_045029) is another VGAM1869 host target gene. LOC257486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257486 BINDING SITE, designated SEQ ID:34325, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62040] Another function of VGAM1869 is therefore inhibition of LOC257486 (Accession XM\_045029). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257486. LOC91300 (Accession NM\_138774) is another VGAM1869 host target gene. LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91300, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or

**BINDING SITE III.** Table 2 illustrates the complementarity of the nucleotide sequences of LOC91300 BINDING SITE1 and LOC91300 BINDING SITE2, designated SEQ ID:29006 and SEQ ID:45387 respectively, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62041] Another function of VGAM1869 is therefore inhibition of LOC91300 (Accession NM\_138774). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91300. LOC92697 (Accession XM\_046715) is another VGAM1869 host target gene. LOC92697 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92697 BINDING SITE, designated SEQ ID:34804, to the nucleotide sequence of VGAM1869 RNA, herein designated VGAM RNA, also designated SEQ ID:4580.

[62042] Another function of VGAM1869 is therefore inhibition of LOC92697 (Accession XM\_046715). Accordingly, utilities of VGAM1869 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC92697. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1870 (VGAM1870) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62043] VGAM1870 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1870 was detected is described hereinabove with reference to Figs. 1–8.

[62044] VGAM1870 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62045] VGAM1870 gene encodes a VGAM1870 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1870 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1870 precursor RNA is desig-

nated SEQ ID:1856, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1856 is located at position 190565 relative to the genome of Fowlpox Virus.

- [62046] VGAM1870 precursor RNA folds onto itself, forming VGAM1870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62047] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1870 folded precursor RNA into VGAM1870 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1870 RNA is designated SEQ ID:4581, and is provided hereinbelow with reference to the sequence

listing part.

[62048] VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1870 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62049] VGAM1870 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1870 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1870 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[62050] The complementary binding of VGAM1870 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1870 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1870 host target RNA into VGAM1870 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62051] It is appreciated that VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1870 host target genes. The mRNA of each one of this plurality of VGAM1870 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1870 RNA, herein designated VGAM

RNA, and which when bound by VGAM1870 RNA causes inhibition of translation of respective one or more VGAM1870 host target proteins.

[62052] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1870 gene, herein designated VGAM GENE, on one or more VGAM1870 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62053] It is yet further appreciated that a function of VGAM1870 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1870 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1870 correlate with, and may be deduced from, the identity of the host target genes which VGAM1870 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62054] Nucleotide sequences of the VGAM1870 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1870 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1870 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1870 are further described hereinbelow with reference to Table 1.

[62055] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1870 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1870 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62056] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1870 gene, herein designated VGAM is

inhibition of expression of VGAM1870 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1870 correlate with, and may be deduced from, the identity of the target genes which VGAM1870 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62057] Zinc Finger Protein 261 (ZNF261, Accession NM\_005096) is a VGAM1870 host target gene. ZNF261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF261 BINDING SITE, designated SEQ ID:11561, to the nucleotide sequence of VGAM1870 RNA, herein designated VGAM RNA, also designated SEQ ID:4581.

[62058] A function of VGAM1870 is therefore inhibition of Zinc Finger Protein 261 (ZNF261, Accession NM\_005096). Accordingly, utilities of VGAM1870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF261. HTEX4 (Accession XM\_166378) is another VGAM1870 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:44213, SEQ ID:46718 and SEQ ID:46649 respectively, to the nucleotide sequence of VGAM1870 RNA, herein designated VGAM RNA, also designated SEQ ID:4581.

[62059] Another function of VGAM1870 is therefore inhibition of HTEX4 (Accession XM\_166378). Accordingly, utilities of VGAM1870 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1871 (VGAM1871) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62060] VGAM1871 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1871 was detected is described hereinabove with reference to Figs. 1–8.

[62061] VGAM1871 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62062] VGAM1871 gene encodes a VGAM1871 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1871 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1871 precursor RNA is designated SEQ ID:1857, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1857 is located at position 195331 relative to the genome of Fowlpox Virus.

[62063] VGAM1871 precursor RNA folds onto itself, forming VGAM1871 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[62064] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1871 folded precursor RNA into VGAM1871 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1871 RNA is designated SEQ ID:4582, and is provided hereinbelow with reference to the sequence listing part.

[62065] VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1871 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62066] VGAM1871 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1871 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1871 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1871 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62067] The complementary binding of VGAM1871 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1871 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1871 host target RNA into VGAM1871 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62068] It is appreciated that VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1871 host target genes. The mRNA of each one of this plurality of VGAM1871 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1871 RNA, herein designated VGAM RNA, and which when bound by VGAM1871 RNA causes inhibition of translation of respective one or more VGAM1871 host target proteins.

[62069] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1871 gene, herein designated VGAM GENE, on one or more VGAM1871 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62070] It is yet further appreciated that a function of VGAM1871 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1871 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1871 correlate with, and may be deduced from, the identity of the host target genes which VGAM1871 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62071] Nucleotide sequences of the VGAM1871 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1871 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1871 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1871 are further described hereinbelow with reference to Table 1.

[62072] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1871 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1871 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62073] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1871 gene, herein designated VGAM is inhibition of expression of VGAM1871 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1871 correlate with, and may be deduced from, the identity of the target genes which VGAM1871 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62074] AFAP (Accession NM\_021638) is a VGAM1871 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of AFAP BINDING SITE, designated SEQ ID:22288, to the nucleotide sequence of VGAM1871 RNA, herein designated VGAM RNA, also designated SEQ ID:4582.

[62075] A function of VGAM1871 is therefore inhibition of AFAP (Accession NM\_021638). Accordingly, utilities of VGAM1871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. ARP3BETA (Accession NM\_020445) is another VGAM1871 host target gene. ARP3BETA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARP3BETA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARP3BETA BINDING SITE, designated SEQ ID:21686, to the nucleotide sequence of VGAM1871 RNA, herein designated VGAM RNA, also designated SEQ ID:4582.

[62076] Another function of VGAM1871 is therefore inhibition of ARP3BETA (Accession NM\_020445). Accordingly, utilities of VGAM1871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARP3BETA. MSTP032 (Accession NM\_025226) is another VGAM1871 host target gene. MSTP032 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP032, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP032 BINDING SITE, designated SEQ ID:24905, to the nucleotide sequence of VGAM1871 RNA, herein designated VGAM RNA, also designated SEQ ID:4582.

[62077] Another function of VGAM1871 is therefore inhibition of MSTP032 (Accession NM\_025226). Accordingly, utilities of VGAM1871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP032. Pleckstrin Homology Domain Containing, Family A (phosphoinositide binding specific) Member 3 (PLEKHA3, Accession NM\_019091) is another VGAM1871 host target gene. PLEKHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLEKHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLEKHA3 BINDING SITE, designated SEQ ID:21168, to the nucleotide sequence of VGAM1871 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4582.

[62078] Another function of VGAM1871 is therefore inhibition of Pleckstrin Homology Domain Containing, Family A (phosphoinositide binding specific) Member 3 (PLEKHA3, Accession NM\_019091). Accordingly, utilities of VGAM1871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEKHA3. PRO2133 (Accession NM\_018619) is another VGAM1871 host target gene. PRO2133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2133 BINDING SITE, designated SEQ ID:20690, to the nucleotide sequence of VGAM1871 RNA, herein designated VGAM RNA, also designated SEQ ID:4582.

[62079] Another function of VGAM1871 is therefore inhibition of PRO2133 (Accession NM\_018619). Accordingly, utilities of VGAM1871 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2133. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1872 (VGAM1872) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62080] VGAM1872 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1872 was detected is described hereinabove with reference to Figs. 1–8.

[62081] VGAM1872 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62082] VGAM1872 gene encodes a VGAM1872 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1872 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1872 precursor RNA is designated SEQ ID:1858, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1858 is located at position 190660 relative to the

genome of Fowlpox Virus.

[62083] VGAM1872 precursor RNA folds onto itself, forming VGAM1872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62084] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1872 folded precursor RNA into VGAM1872 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1872 RNA is designated SEQ ID:4583, and is provided hereinbelow with reference to the sequence listing part.

[62085] VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1872 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[62086] VGAM1872 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1872 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1872 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[62087] The complementary binding of VGAM1872 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1872 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1872 host target RNA into VGAM1872 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62088] It is appreciated that VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1872 host target genes. The mRNA of each one of this plurality of VGAM1872 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1872 RNA, herein designated VGAM RNA, and which when bound by VGAM1872 RNA causes inhibition of translation of respective one or more VGAM1872 host target proteins.

[62089] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1872 gene, herein designated VGAM GENE, on one or more VGAM1872 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62090] It is yet further appreciated that a function of VGAM1872 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1872 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1872 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62091] Nucleotide sequences of the VGAM1872 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1872 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1872 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1872 are further described hereinbelow with reference to Table 1.

[62092] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1872 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1872 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62093] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1872 gene, herein designated VGAM is inhibition of expression of VGAM1872 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1872 correlate with, and may be deduced

from, the identity of the target genes which VGAM1872 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62094] Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3A (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NM\_002711) is a VGAM1872 host target gene. PPP1R3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R3A BINDING SITE, designated SEQ ID:8566, to the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, also designated SEQ ID:4583.

[62095] A function of VGAM1872 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 3A (glycogen and sarcoplasmic reticulum binding subunit, skeletal muscle) (PPP1R3A, Accession NM\_002711), a gene which regulates phosphatase activity towards glycogen synthase, active in skeletal muscle. Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PPP1R3A. The function of PPP1R3A has been established by previous studies. The glycogen-associated form of protein phosphatase-1 (PP1) derived from skeletal muscle is a heterodimer composed of a 37-kD catalytic subunit (OMIM Ref. No. 176875) and a 124-kD targeting and regulatory subunit, referred to as PP1G by Hansen et al. (1995). PP1G binds to muscle glycogen with high affinity, thereby enhancing dephosphorylation of glycogen-bound substrates for PP1 such as glycogen synthase (e.g., 138570) and glycogen phosphorylase kinase (e.g., 306000). Phosphorylation at ser46 of the PP1G subunit in response to insulin increases PP1 activity, while phosphorylation at ser65 in response to adrenaline causes dissociation of the catalytic subunit from the G subunit and inhibits glycogen synthesis. Because of these functions, PP1G was postulated to be involved in noninsulin-dependent diabetes mellitus (NIDDM; 125853) and obesity. Savage et al. (2002) described an example of digenic inheritance of severe insulin resistance. In a family they referred to as 'a Euroid pedigree' they found 5 members with severe insulin resistance and heterozygosity for frameshift/premature stop mutations in each of 2 unlinked genes, PPARC (601487.0011) and PPP1R3A (600917.0003).

PPARG is highly expressed in adipocytes, and PPP1R3A, the muscle-specific regulatory subunit of protein phosphatase 1, is centrally involved in the regulation of carbohydrate and lipid metabolism, respectively. That mutant molecules primarily involved in either carbohydrate or lipid metabolism can combine to produce a phenotype of extreme insulin resistance provides a model of interaction among genes that may underlie common human metabolic disorders such as type 2 diabetes (NIDDM). In the Euroid family reported by Savage et al. (2002), the grandfather was heterozygous for the PPARG mutation, the grandmother was heterozygous for the PPP1R3A mutation. Three of their children and 2 of their grandchildren carried both mutations in heterozygous state, and all 5, but only these 5, had severe insulin resistance manifest by acanthosis nigricans, a dermatologic marker of extreme insulin resistance, and markedly elevated fasting plasma insulin levels.

[62096] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[62097] Savage, D. B.; Agostini, M.; Barroso, I.; Gurnell, M.; Luan, J.; Meirhaeghe, A.; Harding, A.-H.; Ihrke, G.; Rajanayagam,

O.; Soos, M. A.; George, S.; Berger, D.; and 9 others : Di-genic inheritance of severe insulin resistance in a human pedigree. Nature Genet. 31: 379–384, 2002. ; and

[62098] Tang, P. M.; Bondor, J. A.; Swiderek, K. M.; DePaoli-Roach, A. A. : Molecular cloning and expression of the regulatory (RG1) subunit of the glycogen-associated protein phosphatase. J. B.

[62099] Further studies establishing the function and utilities of PPP1R3A are found in John Hopkins OMIM database record ID 600917, and in cited publications numbered 9926, 9953–995 and 9954 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protease, Serine, 16 (thymus) (PRSS16, Accession NM\_005865) is another VGAM1872 host target gene. PRSS16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRSS16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSS16 BINDING SITE, designated SEQ ID:12483, to the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, also designated SEQ ID:4583.

[62100] Another function of VGAM1872 is therefore inhibition of Protease, Serine, 16 (thymus) (PRSS16, Accession NM\_005865). Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRSS16. FLJ13576 (Accession NM\_022484) is another VGAM1872 host target gene. FLJ13576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13576 BINDING SITE, designated SEQ ID:22861, to the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, also designated SEQ ID:4583.

[62101] Another function of VGAM1872 is therefore inhibition of FLJ13576 (Accession NM\_022484). Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13576. KIAA0372 (Accession NM\_014639) is another VGAM1872 host target gene. KIAA0372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0372, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0372 BINDING SITE, designated SEQ ID:16038, to the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, also designated SEQ ID:4583.

[62102] Another function of VGAM1872 is therefore inhibition of KIAA0372 (Accession NM\_014639). Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0372. KIAA1361 (Accession XM\_030845) is another VGAM1872 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31173, to the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, also designated SEQ ID:4583.

[62103] Another function of VGAM1872 is therefore inhibition of KIAA1361 (Accession XM\_030845). Accordingly, utilities of VGAM1872 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1361. LOC222060 (Accession XM\_168427) is another VGAM1872 host target gene. LOC222060 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222060 BINDING SITE, designated SEQ ID:45161, to the nucleotide sequence of VGAM1872 RNA, herein designated VGAM RNA, also designated SEQ ID:4583.

[62104] Another function of VGAM1872 is therefore inhibition of LOC222060 (Accession XM\_168427). Accordingly, utilities of VGAM1872 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222060. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1873 (VGAM1873) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62105] VGAM1873 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1873 was detected is described hereinabove with reference to Figs. 1–8.

[62106] VGAM1873 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62107] VGAM1873 gene encodes a VGAM1873 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1873 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1873 precursor RNA is designated SEQ ID:1859, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1859 is located at position 188015 relative to the genome of Fowlpox Virus.

[62108] VGAM1873 precursor RNA folds onto itself, forming VGAM1873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62109] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1873 folded precursor RNA into VGAM1873 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1873 RNA is designated SEQ ID:4584, and is provided hereinbelow with reference to the sequence listing part.

[62110] VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1873 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62111] VGAM1873 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1873 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1873 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62112] The complementary binding of VGAM1873 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1873 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1873 host target RNA into VGAM1873 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62113] It is appreciated that VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1873 host target genes. The mRNA of each one of this plurality of VGAM1873 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1873 RNA, herein designated VGAM RNA, and which when bound by VGAM1873 RNA causes inhibition of translation of respective one or more VGAM1873 host target proteins.

[62114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1873 gene, herein designated VGAM GENE, on one or more VGAM1873 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62115] It is yet further appreciated that a function of VGAM1873 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1873 correlate with, and may be deduced from, the identity of the host target genes which VGAM1873 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62116] Nucleotide sequences of the VGAM1873 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1873 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1873 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1873 are further described hereinbelow with reference to Table 1.

[62117] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1873 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1873 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62118] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1873 gene, herein designated VGAM is inhibition of expression of VGAM1873 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1873 correlate with, and may be deduced from, the identity of the target genes which VGAM1873 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62119] Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM\_130442) is a VGAM1873 host target gene. ELMO1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by ELMO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELMO1 BINDING SITE, designated SEQ ID:28204, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62120] A function of VGAM1873 is therefore inhibition of Engulfment and Cell Motility 1 (ced-12 homolog, *C. elegans*) (ELMO1, Accession NM\_130442). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELMO1. Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM\_003633) is another VGAM1873 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:9697, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62121] Another function of VGAM1873 is therefore inhibition of Ectodermal–neural Cortex (with BTB–like domain) (ENC1, Accession NM\_003633), a gene which is an actin–binding protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233. Heparanase (HPSE, Accession NM\_006665) is another VGAM1873 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13475, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62122] Another function of VGAM1873 is therefore inhibition of Heparanase (HPSE, Accession NM\_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Ac–

cordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. RAB3B, Member RAS Oncogene Family (RAB3B, Accession NM\_002867) is another VGAM1873 host target gene. RAB3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3B BINDING SITE, designated SEQ ID:8771, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62123] Another function of VGAM1873 is therefore inhibition of RAB3B, Member RAS Oncogene Family (RAB3B, Accession NM\_002867). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3B. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 1 (SLC16A1, Accession NM\_003051) is another VGAM1873

host target gene. SLC16A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC16A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A1 BINDING SITE, designated SEQ ID:9012, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62124] Another function of VGAM1873 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 1 (SLC16A1, Accession NM\_003051), a gene which is a Proton-monocarboxylate cotransporter that transports lactate and pyruvate. Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC16A1. The function of SLC16A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. Zinc Finger Protein 268 (ZNF268, Accession XM\_031851) is another VGAM1873 host target gene. ZNF268 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by ZNF268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF268 BINDING SITE, designated SEQ ID:31500, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62125] Another function of VGAM1873 is therefore inhibition of Zinc Finger Protein 268 (ZNF268, Accession XM\_031851). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF268. Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168) is another VGAM1873 host target gene. ARHE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BINDING SITE, designated SEQ ID:11668, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62126] Another function of VGAM1873 is therefore inhibition of

Ras Homolog Gene Family, Member E (ARHE, Accession NM\_005168). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. FLJ12934 (Accession NM\_022899) is another VGAM1873 host target gene. FLJ12934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12934 BINDING SITE, designated SEQ ID:23175, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62127] Another function of VGAM1873 is therefore inhibition of FLJ12934 (Accession NM\_022899). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12934. HCA4 (Accession XM\_085287) is another VGAM1873 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38030, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62128] Another function of VGAM1873 is therefore inhibition of HCA4 (Accession XM\_085287). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA0427 (Accession NM\_014772) is another VGAM1873 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16571, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62129] Another function of VGAM1873 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0427. LOC116228 (Accession XM\_057659) is another VGAM1873 host target gene. LOC116228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116228 BINDING SITE, designated SEQ ID:36533, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62130] Another function of VGAM1873 is therefore inhibition of LOC116228 (Accession XM\_057659). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116228. LOC221540 (Accession XM\_168133) is another VGAM1873 host target gene. LOC221540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221540 BINDING SITE, designated SEQ ID:45044, to the nucleotide sequence of VGAM1873 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4584.

[62131] Another function of VGAM1873 is therefore inhibition of LOC221540 (Accession XM\_168133). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221540. LOC257545 (Accession XM\_175217) is another VGAM1873 host target gene. LOC257545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257545 BINDING SITE, designated SEQ ID:46692, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62132] Another function of VGAM1873 is therefore inhibition of LOC257545 (Accession XM\_175217). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257545. LOC257598 (Accession XM\_175295) is another VGAM1873 host target gene. LOC257598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257598, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257598 BINDING SITE, designated SEQ ID:46749, to the nucleotide sequence of VGAM1873 RNA, herein designated VGAM RNA, also designated SEQ ID:4584.

[62133] Another function of VGAM1873 is therefore inhibition of LOC257598 (Accession XM\_175295). Accordingly, utilities of VGAM1873 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1874 (VGAM1874) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62134] VGAM1874 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1874 was detected is described hereinabove with reference to Figs. 1-8.

[62135] VGAM1874 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62136] VGAM1874 gene encodes a VGAM1874 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1874 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1874 precursor RNA is designated SEQ ID:1860, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1860 is located at position 196857 relative to the genome of Fowlpox Virus.

[62137] VGAM1874 precursor RNA folds onto itself, forming VGAM1874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62138] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1874 folded precursor RNA into VGAM1874 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1874 RNA is designated SEQ ID:4585, and is provided hereinbelow with reference to the sequence listing part.

[62139] VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1874 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62140] VGAM1874 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1874 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1874 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62141] The complementary binding of VGAM1874 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1874 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1874 host target RNA into VGAM1874 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62142] It is appreciated that VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1874 host target genes. The mRNA of each one of this plurality of VGAM1874 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1874 RNA, herein designated VGAM RNA, and which when bound by VGAM1874 RNA causes inhibition of translation of respective one or more VGAM1874 host target proteins.

[62143] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1874 gene, herein designated VGAM GENE, on one or more VGAM1874 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62144] It is yet further appreciated that a function of VGAM1874 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1874 correlate with, and may be deduced from, the identity of the host target genes which VGAM1874 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62145] Nucleotide sequences of the VGAM1874 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1874 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1874 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1874 are further described hereinbelow with reference to Table 1.

[62146] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1874 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1874 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62147] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1874 gene, herein designated VGAM is inhibition of expression of VGAM1874 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1874 correlate with, and may be deduced from, the identity of the target genes which VGAM1874 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62148] Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM\_002483) is a VGAM1874 host target gene. CEACAM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CEACAM6 BINDING SITE, designated SEQ ID:8307, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62149] A function of VGAM1874 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 6 (non-specific cross reacting antigen) (CEACAM6, Accession NM\_002483), a gene which Non-specific cross reacting antigen (. Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM6. The function of CEACAM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM286. Matrix Metalloproteinase 19 (MMP19, Accession NM\_022790) is another VGAM1874 host target gene. MMP19 BINDING SITE1 and MMP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 and MMP19 BINDING SITE2, designated SEQ

ID:23072 and SEQ ID:23081 respectively, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62150] Another function of VGAM1874 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM\_022790). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP19. DREV1 (Accession NM\_016025) is another VGAM1874 host target gene. DREV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DREV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DREV1 BINDING SITE, designated SEQ ID:18106, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62151] Another function of VGAM1874 is therefore inhibition of DREV1 (Accession NM\_016025). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DREV1. Potassium Voltage-gated Channel, Isk-related Family,

Member 4 (KCNE4, Accession NM\_080671) is another VGAM1874 host target gene. KCNE4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNE4 BINDING SITE, designated SEQ ID:27967, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62152] Another function of VGAM1874 is therefore inhibition of Potassium Voltage-gated Channel, Isk-related Family, Member 4 (KCNE4, Accession NM\_080671). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE4. Phospholipid Scramblase 4 (PLSCR4, Accession NM\_020353) is another VGAM1874 host target gene. PLSCR4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLSCR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLSCR4 BINDING SITE, designated SEQ

ID:21619, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62153] Another function of VGAM1874 is therefore inhibition of Phospholipid Scramblase 4 (PLSCR4, Accession NM\_020353). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR4. LOC163033 (Accession XM\_091949) is another VGAM1874 host target gene. LOC163033 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163033 BINDING SITE, designated SEQ ID:40072, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62154] Another function of VGAM1874 is therefore inhibition of LOC163033 (Accession XM\_091949). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163033. LOC219920 (Accession XM\_167787) is an-

other VGAM1874 host target gene. LOC219920 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219920 BINDING SITE, designated SEQ ID:44801, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62155] Another function of VGAM1874 is therefore inhibition of LOC219920 (Accession XM\_167787). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219920. LOC253598 (Accession XM\_175049) is another VGAM1874 host target gene. LOC253598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253598 BINDING SITE, designated SEQ ID:46609, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62156] Another function of VGAM1874 is therefore inhibition of LOC253598 (Accession XM\_175049). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253598. LOC254173 (Accession XM\_173022) is another VGAM1874 host target gene. LOC254173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254173 BINDING SITE, designated SEQ ID:46285, to the nucleotide sequence of VGAM1874 RNA, herein designated VGAM RNA, also designated SEQ ID:4585.

[62157] Another function of VGAM1874 is therefore inhibition of LOC254173 (Accession XM\_173022). Accordingly, utilities of VGAM1874 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254173. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1875 (VGAM1875) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[62158] VGAM1875 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1875 was detected is described hereinabove with reference to Figs. 1-8.

[62159] VGAM1875 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62160] VGAM1875 gene encodes a VGAM1875 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1875 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1875 precursor RNA is designated SEQ ID:1861, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1861 is located at position 187831 relative to the genome of Fowlpox Virus.

[62161] VGAM1875 precursor RNA folds onto itself, forming VGAM1875 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62162] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1875 folded precursor RNA into VGAM1875 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM1875 RNA is designated SEQ ID:4586, and is provided hereinbelow with reference to the sequence listing part.

[62163] VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1875 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62164] VGAM1875 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1875 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1875 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62165] The complementary binding of VGAM1875 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1875 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1875 host target RNA into VGAM1875 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62166] It is appreciated that VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1875 host target genes. The mRNA of each one of this plurality of VGAM1875 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1875 RNA, herein designated VGAM RNA, and which when bound by VGAM1875 RNA causes inhibition of translation of respective one or more VGAM1875 host target proteins.

[62167] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1875 gene, herein designated VGAM GENE, on one or more VGAM1875 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62168] It is yet further appreciated that a function of VGAM1875 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1875 correlate with, and may be deduced from, the identity of the host target genes which VGAM1875 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[62169] Nucleotide sequences of the VGAM1875 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1875 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1875 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1875 are further described hereinbelow with reference to Table 1.

[62170] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1875 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1875 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62171] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1875 gene, herein designated VGAM is inhibition of expression of VGAM1875 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1875 correlate with, and may be deduced from, the identity of the target genes which VGAM1875 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62172] Cadherin 13, H-cadherin (heart) (CDH13, Accession NM\_001257) is a VGAM1875 host target gene. CDH13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH13 BINDING SITE, designated SEQ ID:6925, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62173] A function of VGAM1875 is therefore inhibition of Cadherin 13, H-cadherin (heart) (CDH13, Accession NM\_001257). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH13. Coagulation Factor XIII, A1 Polypeptide (F13A1, Accession XM\_165833) is another VGAM1875 host target gene. F13A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by F13A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F13A1 BINDING SITE, designated SEQ ID:43774, to the nucleotide se-

quence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62174] Another function of VGAM1875 is therefore inhibition of Coagulation Factor XIII, A1 Polypeptide (F13A1, Accession XM\_165833). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F13A1. Heparanase (HPSE, Accession NM\_006665) is another VGAM1875 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13482, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62175] Another function of VGAM1875 is therefore inhibition of Heparanase (HPSE, Accession NM\_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. Palmitoyl-protein Thioesterase 2 (PPT2, Accession NM\_138717) is another VGAM1875 host target gene. PPT2 BINDING SITE1 and PPT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE1 and PPT2 BINDING SITE2, designated SEQ ID:28965 and SEQ ID:11634 respectively, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62176] Another function of VGAM1875 is therefore inhibition of Palmitoyl-protein Thioesterase 2 (PPT2, Accession NM\_138717), a gene which is a palmitoyl-protein

thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2. The function of PPT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.KIAA0836 (Accession XM\_035390) is another VGAM1875 host target gene. KIAA0836 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0836 BINDING SITE, designated SEQ ID:32247, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62177] Another function of VGAM1875 is therefore inhibition of KIAA0836 (Accession XM\_035390). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0836. KIAA0953 (Accession XM\_039733) is another VGAM1875 host target gene. KIAA0953 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0953 BINDING SITE, designated SEQ ID:33168, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62178] Another function of VGAM1875 is therefore inhibition of KIAA0953 (Accession XM\_039733). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0953. PRO2958 (Accession NM\_018546) is another VGAM1875 host target gene. PRO2958 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2958 BINDING SITE, designated SEQ ID:20624, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62179] Another function of VGAM1875 is therefore inhibition of

PRO2958 (Accession NM\_018546). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2958. Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM\_004713) is another VGAM1875 host target gene. SDCCAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDCCAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDCCAG1 BINDING SITE, designated SEQ ID:11070, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62180] Another function of VGAM1875 is therefore inhibition of Serologically Defined Colon Cancer Antigen 1 (SDCCAG1, Accession NM\_004713). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDCCAG1. Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967) is another VGAM1875 host target gene. SNTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SNTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTG1 BINDING SITE, designated SEQ ID:21037, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62181] Another function of VGAM1875 is therefore inhibition of Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG1. LOC120856 (Accession XM\_058509) is another VGAM1875 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36642, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62182] Another function of VGAM1875 is therefore inhibition of

LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC131744 (Accession XM\_067529) is another VGAM1875 host target gene. LOC131744 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131744 BINDING SITE, designated SEQ ID:37358, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62183] Another function of VGAM1875 is therefore inhibition of LOC131744 (Accession XM\_067529). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131744. LOC147172 (Accession XM\_085729) is another VGAM1875 host target gene. LOC147172 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147172 BINDING SITE, designated SEQ ID:38313, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62184] Another function of VGAM1875 is therefore inhibition of LOC147172 (Accession XM\_085729). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147172. LOC152195 (Accession XM\_098172) is another VGAM1875 host target gene. LOC152195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152195 BINDING SITE, designated SEQ ID:41435, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62185] Another function of VGAM1875 is therefore inhibition of LOC152195 (Accession XM\_098172). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152195. LOC153454 (Accession XM\_087672) is an-

other VGAM1875 host target gene. LOC153454 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153454, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153454 BINDING SITE, designated SEQ ID:39375, to the nucleotide sequence of VGAM1875 RNA, herein designated VGAM RNA, also designated SEQ ID:4586.

[62186] Another function of VGAM1875 is therefore inhibition of LOC153454 (Accession XM\_087672). Accordingly, utilities of VGAM1875 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153454. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1876 (VGAM1876) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62187] VGAM1876 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1876 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[62188] VGAM1876 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus.

VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62189] VGAM1876 gene encodes a VGAM1876 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1876 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1876 precursor RNA is designated SEQ ID:1862, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1862 is located at position 194761 relative to the genome of Fowlpox Virus.

[62190] VGAM1876 precursor RNA folds onto itself, forming VGAM1876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62191] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1876 folded precursor RNA into VGAM1876 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1876 RNA is designated SEQ ID:4587, and is provided hereinbelow with reference to the sequence listing part.

[62192] VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1876 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62193] VGAM1876 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1876 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1876 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1876 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62194] The complementary binding of VGAM1876 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1876 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1876 host target RNA into VGAM1876 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62195] It is appreciated that VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1876 host target genes. The mRNA of each one of this plurality of VGAM1876 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1876 RNA, herein designated VGAM RNA, and which when bound by VGAM1876 RNA causes inhibition of translation of respective one or more VGAM1876 host target proteins.

[62196] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1876 gene, herein designated VGAM GENE, on one or more VGAM1876 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62197] It is yet further appreciated that a function of VGAM1876 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1876 correlate with, and may be deduced from, the identity of the host target genes which VGAM1876 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62198] Nucleotide sequences of the VGAM1876 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1876 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1876 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1876 are further described hereinbelow with reference to Table 1.

[62199] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1876 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1876 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62200] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1876 gene, herein designated VGAM is inhibition of expression of VGAM1876 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1876 correlate with, and may be deduced from, the identity of the target genes which VGAM1876 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62201] Complement Component 7 (C7, Accession NM\_000587) is a VGAM1876 host target gene. C7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C7 BINDING SITE, designated SEQ ID:6188, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62202] A function of VGAM1876 is therefore inhibition of Complement Component 7 (C7, Accession NM\_000587). Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C7. Calumenin (CALU, Accession NM\_001219) is another VGAM1876 host target gene. CALU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:6884, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62203] Another function of VGAM1876 is therefore inhibition of Calumenin (CALU, Accession NM\_001219), a gene which binds 7 calcium ions with a low affinity with unidentified function. Accordingly, utilities of VGAM1876 include diag-

nosis, prevention and treatment of diseases and clinical conditions associated with CALU. The function of CALU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM253. Heparanase (HPSE, Accession NM\_006665) is another VGAM1876 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13478, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62204] Another function of VGAM1876 is therefore inhibition of Heparanase (HPSE, Accession NM\_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPSE. The function of HPSE and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM374. Prostaglandin F Receptor (FP) (PTGFR, Accession NM\_000959) is another VGAM1876 host target gene. PTGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFR BINDING SITE, designated SEQ ID:6662, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62205] Another function of VGAM1876 is therefore inhibition of Prostaglandin F Receptor (FP) (PTGFR, Accession NM\_000959), a gene which mediates intracellular calcium flux, strongly similar to murine Ptgfr. Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFR. The function of PTGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1781. RAB18, Member RAS Oncogene Family (RAB18, Accession NM\_021252) is another VGAM1876 host target gene. RAB18 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB18 BINDING SITE, designated SEQ ID:22220, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62206] Another function of VGAM1876 is therefore inhibition of RAB18, Member RAS Oncogene Family (RAB18, Accession NM\_021252), a gene which plays a role in apical endocytosis/recycling. Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB18. The function of RAB18 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911) is another VGAM1876 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25664, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62207] Another function of VGAM1876 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911). Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. FLJ13340 (Accession NM\_057175) is another VGAM1876 host target gene. FLJ13340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13340 BINDING SITE, designated SEQ ID:27708, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62208] Another function of VGAM1876 is therefore inhibition of FLJ13340 (Accession NM\_057175). Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ13340. FLJ14621 (Accession NM\_032811) is another VGAM1876 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26579, to the nucleotide sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62209] Another function of VGAM1876 is therefore inhibition of FLJ14621 (Accession NM\_032811). Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. TBDN100 (Accession NM\_025085) is another VGAM1876 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24699, to the nucleotide

sequence of VGAM1876 RNA, herein designated VGAM RNA, also designated SEQ ID:4587.

[62210] Another function of VGAM1876 is therefore inhibition of TBDN100 (Accession NM\_025085). Accordingly, utilities of VGAM1876 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1877 (VGAM1877) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62211] VGAM1877 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1877 was detected is described hereinabove with reference to Figs. 1–8.

[62212] VGAM1877 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowlpox Virus. VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62213] VGAM1877 gene encodes a VGAM1877 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1877 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1877 precursor RNA is designated SEQ ID:1863, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1863 is located at position 184855 relative to the genome of Fowlpox Virus.

- [62214] VGAM1877 precursor RNA folds onto itself, forming VGAM1877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62215] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1877 folded precursor RNA into VGAM1877 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1877 RNA is designated SEQ ID:4588, and is provided hereinbelow with reference to the sequence listing part.

[62216] VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1877 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62217] VGAM1877 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1877 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1877 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62218] The complementary binding of VGAM1877 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1877 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1877 host target RNA into VGAM1877 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62219] It is appreciated that VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1877 host target genes. The mRNA of each one of this plurality of VGAM1877 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1877 RNA, herein designated VGAM RNA, and which when bound by VGAM1877 RNA causes inhibition of translation of respective one or more VGAM1877 host target proteins.

[62220] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1877 gene, herein designated VGAM GENE, on one or more VGAM1877 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[62221] It is yet further appreciated that a function of VGAM1877 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of viral infection by Fowlpox Virus. Specific functions, and accordingly utilities, of VGAM1877 correlate with, and may be deduced from, the identity of the host target genes which VGAM1877 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62222] Nucleotide sequences of the VGAM1877 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1877 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1877 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1877 are further described hereinbelow with reference to Table 1.

[62223] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1877 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1877 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62224] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1877 gene, herein designated VGAM is inhibition of expression of VGAM1877 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1877 correlate with, and may be deduced from, the identity of the target genes which VGAM1877 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62225] A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is a VGAM1877 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18372, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62226] A function of VGAM1877 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession

NM\_016248). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. CG012 (Accession XM\_096710) is another VGAM1877 host target gene.

CG012 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG012 BINDING SITE, designated SEQ ID:40490, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62227] Another function of VGAM1877 is therefore inhibition of CG012 (Accession XM\_096710). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG012. KIAA0565 (Accession XM\_039912) is another VGAM1877 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0565 BINDING SITE, designated SEQ ID:33222, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62228] Another function of VGAM1877 is therefore inhibition of KIAA0565 (Accession XM\_039912). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. Methionyl Aminopeptidase 1 (METAP1, Accession XM\_052334) is another VGAM1877 host target gene. METAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by METAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of METAP1 BINDING SITE, designated SEQ ID:35959, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62229] Another function of VGAM1877 is therefore inhibition of Methionyl Aminopeptidase 1 (METAP1, Accession XM\_052334). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with METAP1. PTD002 (Accession NM\_016144) is another VGAM1877 host target gene. PTD002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTD002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD002 BINDING SITE, designated SEQ ID:18228, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62230] Another function of VGAM1877 is therefore inhibition of PTD002 (Accession NM\_016144). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD002. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM\_088733) is another VGAM1877 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ

ID:39928, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62231] Another function of VGAM1877 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM\_088733). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. LOC146723 (Accession XM\_085565) is another VGAM1877 host target gene. LOC146723 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146723, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146723 BINDING SITE, designated SEQ ID:38228, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62232] Another function of VGAM1877 is therefore inhibition of LOC146723 (Accession XM\_085565). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146723. LOC147341 (Accession XM\_097223) is an-

other VGAM1877 host target gene. LOC147341 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147341, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147341 BINDING SITE, designated SEQ ID:40826, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62233] Another function of VGAM1877 is therefore inhibition of LOC147341 (Accession XM\_097223). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147341. LOC196528 (Accession XM\_113745) is another VGAM1877 host target gene. LOC196528 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196528 BINDING SITE, designated SEQ ID:42408, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62234] Another function of VGAM1877 is therefore inhibition of LOC196528 (Accession XM\_113745). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196528. LOC203276 (Accession XM\_117523) is another VGAM1877 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43491, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62235] Another function of VGAM1877 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM1877 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43515, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62236] Another function of VGAM1877 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC221662 (Accession XM\_166466) is another VGAM1877 host target gene. LOC221662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221662 BINDING SITE, designated SEQ ID:44391, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62237] Another function of VGAM1877 is therefore inhibition of LOC221662 (Accession XM\_166466). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221662. LOC254243 (Accession XM\_173233) is another VGAM1877 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46517, to the nucleotide sequence of VGAM1877 RNA, herein designated VGAM RNA, also designated SEQ ID:4588.

[62238] Another function of VGAM1877 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC90038 (Accession XM\_028305) is another VGAM1877 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30654, to the nucleotide sequence of VGAM1877 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4588.

[62239] Another function of VGAM1877 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM1877 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1878 (VGAM1878) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62240] VGAM1878 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1878 was detected is described hereinabove with reference to Figs. 1–8.

[62241] VGAM1878 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62242] VGAM1878 gene encodes a VGAM1878 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1878 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1878 precursor RNA is designated SEQ ID:1864, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1864 is located at position 7295 relative to the genome of Bovine Respiratory Syncytial Virus.

[62243] VGAM1878 precursor RNA folds onto itself, forming VGAM1878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62244] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1878 folded precursor RNA into VGAM1878 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM1878 RNA is designated SEQ ID:4589, and is provided hereinbelow with reference to the sequence listing part.

[62245] VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1878 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62246] VGAM1878 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1878 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1878 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[62247] The complementary binding of VGAM1878 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1878 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1878 host target RNA into VGAM1878 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62248] It is appreciated that VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1878 host target genes. The mRNA of

each one of this plurality of VGAM1878 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1878 RNA, herein designated VGAM RNA, and which when bound by VGAM1878 RNA causes inhibition of translation of respective one or more VGAM1878 host target proteins.

[62249] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1878 gene, herein designated VGAM GENE, on one or more VGAM1878 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[62250] It is yet further appreciated that a function of VGAM1878 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1878 correlate with, and may be deduced from, the identity of the host target genes which VGAM1878 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62251] Nucleotide sequences of the VGAM1878 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1878 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1878 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1878 are further described hereinbelow with reference to Table 1.

[62252] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1878 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1878 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62253] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1878 gene, herein designated VGAM is inhibition of expression of VGAM1878 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1878 correlate with, and may be deduced from, the identity of the target genes which VGAM1878 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62254] DKFZp434J1015 (Accession XM\_166538) is a VGAM1878 host target gene. DKFZp434J1015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434J1015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J1015 BINDING SITE, designated SEQ ID:44505, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62255] A function of VGAM1878 is therefore inhibition of DKFZp434J1015 (Accession XM\_166538). Accordingly, utilities of VGAM1878 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp434J1015. Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM\_057927) is another VGAM1878 host target gene. FHOD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FHOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHOD2 BINDING SITE, designated SEQ ID:36554, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62256] Another function of VGAM1878 is therefore inhibition of Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM\_057927). Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHOD2. FLJ32784 (Accession NM\_144623) is another VGAM1878 host target gene. FLJ32784 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ32784 BINDING SITE, designated SEQ ID:29441, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62257] Another function of VGAM1878 is therefore inhibition of FLJ32784 (Accession NM\_144623). Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32784. LOC146520 (Accession XM\_085492) is another VGAM1878 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38184, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62258] Another function of VGAM1878 is therefore inhibition of LOC146520 (Accession XM\_085492). Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC149711 (Accession XM\_097720) is an-

other VGAM1878 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:41073, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62259] Another function of VGAM1878 is therefore inhibition of LOC149711 (Accession XM\_097720). Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC150113 (Accession XM\_104532) is another VGAM1878 host target gene. LOC150113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150113 BINDING SITE, designated SEQ ID:42170, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62260] Another function of VGAM1878 is therefore inhibition of LOC150113 (Accession XM\_104532). Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150113. LOC90288 (Accession XM\_030669) is another VGAM1878 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31115, to the nucleotide sequence of VGAM1878 RNA, herein designated VGAM RNA, also designated SEQ ID:4589.

[62261] Another function of VGAM1878 is therefore inhibition of LOC90288 (Accession XM\_030669). Accordingly, utilities of VGAM1878 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1879 (VGAM1879) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[62262] VGAM1879 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1879 was detected is described hereinabove with reference to Figs. 1–8.

[62263] VGAM1879 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62264] VGAM1879 gene encodes a VGAM1879 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1879 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1879 precursor RNA is designated SEQ ID:1865, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1865 is located at position 5455 relative to the genome of Bovine Respiratory Syncytial Virus.

[62265] VGAM1879 precursor RNA folds onto itself, forming VGAM1879 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62266] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1879 folded precursor RNA into VGAM1879 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1879 RNA is designated SEQ ID:4590, and is provided hereinbelow with reference to the sequence listing part.

[62267] VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1879 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62268] VGAM1879 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1879 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1879 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62269] The complementary binding of VGAM1879 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1879 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1879 host target RNA into VGAM1879 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62270] It is appreciated that VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1879 host target genes. The mRNA of each one of this plurality of VGAM1879 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1879 RNA, herein designated VGAM RNA, and which when bound by VGAM1879 RNA causes inhibition of translation of respective one or more VGAM1879 host target proteins.

[62271] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1879 gene, herein designated VGAM GENE, on one or more VGAM1879 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62272] It is yet further appreciated that a function of VGAM1879 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1879 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1879 correlate with, and may be deduced from, the identity of the host target genes which VGAM1879 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[62273] Nucleotide sequences of the VGAM1879 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1879 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1879 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1879 are further described hereinbelow with reference to Table 1.

[62274] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1879 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1879 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62275] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1879 gene, herein designated VGAM is inhibition of expression of VGAM1879 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1879 correlate with, and may be deduced from, the identity of the target genes which VGAM1879 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62276] Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM\_002816) is a VGAM1879 host target gene. PSMD12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMD12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD12 BINDING SITE, designated SEQ ID:8682, to the nucleotide sequence of VGAM1879 RNA, herein designated VGAM RNA, also designated SEQ ID:4590.

[62277] A function of VGAM1879 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 12 (PSMD12, Accession NM\_002816). Accordingly, utilities of VGAM1879 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD12. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1880 (VGAM1880) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62278] VGAM1880 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1880 was detected is described hereinabove with reference to Figs. 1-8.

[62279] VGAM1880 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62280] VGAM1880 gene encodes a VGAM1880 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1880 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1880 precursor RNA is designated SEQ ID:1866, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1866 is located at position 14933 relative to the genome of Bovine Respiratory Syncytial Virus.

[62281] VGAM1880 precursor RNA folds onto itself, forming VGAM1880 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62282] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1880 folded precursor RNA into VGAM1880 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1880 RNA is designated SEQ ID:4591, and is provided hereinbelow with reference to the sequence listing part.

[62283] VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1880 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[62284] VGAM1880 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1880 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1880 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62285] The complementary binding of VGAM1880 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1880 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1880 host target RNA into VGAM1880 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62286] It is appreciated that VGAM1880 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1880 host target genes. The mRNA of each one of this plurality of VGAM1880 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1880 RNA, herein designated VGAM RNA, and which when bound by VGAM1880 RNA causes inhibition of translation of respective one or more VGAM1880 host target proteins.

[62287] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1880 gene, herein designated VGAM GENE, on one or more VGAM1880 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62288] It is yet further appreciated that a function of VGAM1880 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1880 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1880 correlate with, and may be deduced from, the identity of the host target genes which VGAM1880 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62289] Nucleotide sequences of the VGAM1880 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1880 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1880 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1880 are further  
described hereinbelow with reference to Table 1.

[62290] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1880 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1880 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[62291] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1880 gene, herein designated VGAM is  
inhibition of expression of VGAM1880 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1880 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1880  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[62292] Cytochrome P450, Subfamily I (aromatic compound-in-  
ducible), Polypeptide 1 (CYP1A1, Accession NM\_000499)

is a VGAM1880 host target gene. CYP1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A1 BINDING SITE, designated SEQ ID:6113, to the nucleotide sequence of VGAM1880 RNA, herein designated VGAM RNA, also designated SEQ ID:4591.

[62293] A function of VGAM1880 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 1 (CYP1A1, Accession NM\_000499), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM1880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A1. The function of CYP1A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM335.FLJ10781 (Accession NM\_018215) is another VGAM1880 host target gene. FLJ10781 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10781, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10781 BINDING SITE, designated SEQ ID:20132, to the nucleotide sequence of VGAM1880 RNA, herein designated VGAM RNA, also designated SEQ ID:4591.

[62294] Another function of VGAM1880 is therefore inhibition of FLJ10781 (Accession NM\_018215). Accordingly, utilities of VGAM1880 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10781. LOC51580 (Accession NM\_015874) is another VGAM1880 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18013, to the nucleotide sequence of VGAM1880 RNA, herein designated VGAM RNA, also designated SEQ ID:4591.

[62295] Another function of VGAM1880 is therefore inhibition of LOC51580 (Accession NM\_015874). Accordingly, utilities of VGAM1880 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC51580. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1881 (VGAM1881) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62296] VGAM1881 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1881 was detected is described hereinabove with reference to Figs. 1–8.

[62297] VGAM1881 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62298] VGAM1881 gene encodes a VGAM1881 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1881 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1881 precursor RNA is desig-

nated SEQ ID:1867, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1867 is located at position 7527 relative to the genome of Bovine Respiratory Syncytial Virus.

- [62299] VGAM1881 precursor RNA folds onto itself, forming VGAM1881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62300] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1881 folded precursor RNA into VGAM1881 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1881 RNA is designated SEQ ID:4592, and is provided hereinbelow with reference to the sequence

listing part.

[62301] VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1881 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62302] VGAM1881 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1881 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1881 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62303] The complementary binding of VGAM1881 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1881 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1881 host target RNA into VGAM1881 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62304] It is appreciated that VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1881 host target genes. The mRNA of each one of this plurality of VGAM1881 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1881 RNA, herein designated VGAM

RNA, and which when bound by VGAM1881 RNA causes inhibition of translation of respective one or more VGAM1881 host target proteins.

[62305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1881 gene, herein designated VGAM GENE, on one or more VGAM1881 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62306] It is yet further appreciated that a function of VGAM1881 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1881 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1881 correlate with, and may be deduced from, the identity of the host target genes which VGAM1881 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62307] Nucleotide sequences of the VGAM1881 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1881 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1881 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1881 are further described hereinbelow with reference to Table 1.

[62308] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1881 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1881 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62309] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1881 gene, herein designated VGAM is

inhibition of expression of VGAM1881 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1881 correlate with, and may be deduced from, the identity of the target genes which VGAM1881 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62310] Hepatic Leukemia Factor (HLF, Accession NM\_002126) is a VGAM1881 host target gene. HLF BINDING SITE1 and HLF BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HLF, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLF BINDING SITE1 and HLF BINDING SITE2, designated SEQ ID:7900 and SEQ ID:7901 respectively, to the nucleotide sequence of VGAM1881 RNA, herein designated VGAM RNA, also designated SEQ ID:4592.

[62311] A function of VGAM1881 is therefore inhibition of Hepatic Leukemia Factor (HLF, Accession NM\_002126). Accordingly, utilities of VGAM1881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLF. KIAA0594 (Accession XM\_036117) is another VGAM1881 host target gene. KIAA0594 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:32389, to the nucleotide sequence of VGAM1881 RNA, herein designated VGAM RNA, also designated SEQ ID:4592.

[62312] Another function of VGAM1881 is therefore inhibition of KIAA0594 (Accession XM\_036117). Accordingly, utilities of VGAM1881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. KIAA1040 (Accession XM\_051091) is another VGAM1881 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35736, to the nucleotide sequence of VGAM1881 RNA, herein designated VGAM RNA, also designated SEQ ID:4592.

[62313] Another function of VGAM1881 is therefore inhibition of

KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM1881 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1882 (VGAM1882) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62314] VGAM1882 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1882 was detected is described hereinabove with reference to Figs. 1-8.

[62315] VGAM1882 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62316] VGAM1882 gene encodes a VGAM1882 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1882 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1882 precursor RNA is designated SEQ ID:1868, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1868 is located at position 417 relative to the genome of Bovine Respiratory Syncytial Virus.

- [62317] VGAM1882 precursor RNA folds onto itself, forming VGAM1882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62318] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1882 folded precursor RNA into VGAM1882 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide se-

quence of VGAM1882 RNA is designated SEQ ID:4593, and is provided hereinbelow with reference to the sequence listing part.

[62319] VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1882 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62320] VGAM1882 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1882 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1882 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62321] The complementary binding of VGAM1882 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1882 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1882 host target RNA into VGAM1882 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62322] It is appreciated that VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1882 host target genes. The mRNA of each one of this plurality of VGAM1882 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1882 RNA, herein designated VGAM RNA, and which when bound by VGAM1882 RNA causes inhibition of translation of respective one or more VGAM1882 host target proteins.

[62323] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1882 gene, herein designated VGAM GENE, on one or more VGAM1882 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62324] It is yet further appreciated that a function of VGAM1882

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1882 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1882 correlate with, and may be deduced from, the identity of the host target genes which VGAM1882 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62325] Nucleotide sequences of the VGAM1882 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1882 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1882 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1882 are further described hereinbelow with reference to Table 1.

[62326] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1882 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1882 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62327] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1882 gene, herein designated VGAM is inhibition of expression of VGAM1882 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1882 correlate with, and may be deduced from, the identity of the target genes which VGAM1882 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62328] Caveolin 1, Caveolae Protein, 22kDa (CAV1, Accession NM\_001753) is a VGAM1882 host target gene. CAV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAV1 BINDING SITE, designated SEQ ID:7490, to the nucleotide sequence of VGAM1882 RNA, herein designated VGAM RNA, also designated SEQ ID:4593.

[62329] A function of VGAM1882 is therefore inhibition of Caveolin 1, Caveolae Protein, 22kDa (CAV1, Accession NM\_001753), a gene which may act as a scaffolding protein within caveolar membranes, and interacts directly with g-protein alpha subunits and can functionally regu-

late their activity. Accordingly, utilities of VGAM1882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAV1. The function of CAV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM331.FLJ30294 (Accession NM\_144632) is another VGAM1882 host target gene. FLJ30294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30294 BINDING SITE, designated SEQ ID:29452, to the nucleotide sequence of VGAM1882 RNA, herein designated VGAM RNA, also designated SEQ ID:4593.

[62330] Another function of VGAM1882 is therefore inhibition of FLJ30294 (Accession NM\_144632). Accordingly, utilities of VGAM1882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30294. KIAA1571 (Accession XM\_027744) is another VGAM1882 host target gene. KIAA1571 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1571 BINDING SITE, designated SEQ ID:30567, to the nucleotide sequence of VGAM1882 RNA, herein designated VGAM RNA, also designated SEQ ID:4593.

[62331] Another function of VGAM1882 is therefore inhibition of KIAA1571 (Accession XM\_027744). Accordingly, utilities of VGAM1882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1571. LOC201965 (Accession XM\_114412) is another VGAM1882 host target gene. LOC201965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201965 BINDING SITE, designated SEQ ID:42931, to the nucleotide sequence of VGAM1882 RNA, herein designated VGAM RNA, also designated SEQ ID:4593.

[62332] Another function of VGAM1882 is therefore inhibition of LOC201965 (Accession XM\_114412). Accordingly, utilities

of VGAM1882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201965. LOC257017 (Accession XM\_173227) is another VGAM1882 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46494, to the nucleotide sequence of VGAM1882 RNA, herein designated VGAM RNA, also designated SEQ ID:4593.

[62333] Another function of VGAM1882 is therefore inhibition of LOC257017 (Accession XM\_173227). Accordingly, utilities of VGAM1882 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1883 (VGAM1883) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62334] VGAM1883 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1883 was detected is described hereinabove with reference to Figs. 1-8.

[62335] VGAM1883 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62336] VGAM1883 gene encodes a VGAM1883 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1883 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1883 precursor RNA is designated SEQ ID:1869, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1869 is located at position 10923 relative to the genome of Bovine Respiratory Syncytial Virus.

[62337] VGAM1883 precursor RNA folds onto itself, forming VGAM1883 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62338] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1883 folded precursor RNA into VGAM1883 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1883 RNA is designated SEQ ID:4594, and is provided hereinbelow with reference to the sequence listing part.

[62339] VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1883 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[62340] VGAM1883 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1883 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1883 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62341] The complementary binding of VGAM1883 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1883 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1883 host target RNA into VGAM1883 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62342] It is appreciated that VGAM1883 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1883 host target genes. The mRNA of each one of this plurality of VGAM1883 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1883 RNA, herein designated VGAM RNA, and which when bound by VGAM1883 RNA causes inhibition of translation of respective one or more VGAM1883 host target proteins.

[62343] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1883 gene, herein designated VGAM GENE, on one or more VGAM1883 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62344] It is yet further appreciated that a function of VGAM1883 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1883 correlate with, and may be deduced from, the identity of the host target genes which VGAM1883 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62345] Nucleotide sequences of the VGAM1883 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1883 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1883 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1883 are further  
described hereinbelow with reference to Table 1.

[62346] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1883 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1883 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[62347] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1883 gene, herein designated VGAM is  
inhibition of expression of VGAM1883 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1883 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1883  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[62348] Glutaminase (GLS, Accession NM\_014905) is a VGAM1883  
host target gene. GLS BINDING SITE is HOST TARGET bind-

ing site found in the 3` untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17109, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62349] A function of VGAM1883 is therefore inhibition of Glutaminase (GLS, Accession NM\_014905). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Matrix Metalloproteinase 8 (neutrophil collagenase) (MMP8, Accession NM\_002424) is another VGAM1883 host target gene. MMP8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MMP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP8 BINDING SITE, designated SEQ ID:8257, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62350] Another function of VGAM1883 is therefore inhibition of Matrix Metalloproteinase 8 (neutrophil collagenase) (MMP8, Accession NM\_002424). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP8. Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655) is another VGAM1883 host target gene. SELL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELL BINDING SITE, designated SEQ ID:6314, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62351] Another function of VGAM1883 is therefore inhibition of Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655), a gene which is a cell surface adhesion protein. Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELL. The function of SELL and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM374.DKFZP564D206 (Accession XM\_166501) is another VGAM1883 host target gene. DKFZP564D206 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D206 BINDING SITE, designated SEQ ID:44427, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62352] Another function of VGAM1883 is therefore inhibition of DKFZP564D206 (Accession XM\_166501). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D206. DKFZP564I0422 (Accession NM\_031435) is another VGAM1883 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25433, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62353] Another function of VGAM1883 is therefore inhibition of DKFZP564I0422 (Accession NM\_031435). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. FLJ23189 (Accession NM\_025057) is another VGAM1883 host target gene. FLJ23189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23189 BINDING SITE, designated SEQ ID:24655, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62354] Another function of VGAM1883 is therefore inhibition of FLJ23189 (Accession NM\_025057). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23189. P37NB (Accession NM\_005824) is another

VGAM1883 host target gene. P37NB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P37NB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P37NB BINDING SITE, designated SEQ ID:12433, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62355] Another function of VGAM1883 is therefore inhibition of P37NB (Accession NM\_005824). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P37NB. Vesicular Membrane Protein P24 (VMP, Accession NM\_080723) is another VGAM1883 host target gene. VMP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VMP BINDING SITE, designated SEQ ID:28016, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62356] Another function of VGAM1883 is therefore inhibition of Vesicular Membrane Protein P24 (VMP, Accession NM\_080723). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VMP. LOC170063 (Accession XM\_104820) is another VGAM1883 host target gene. LOC170063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170063 BINDING SITE, designated SEQ ID:42187, to the nucleotide sequence of VGAM1883 RNA, herein designated VGAM RNA, also designated SEQ ID:4594.

[62357] Another function of VGAM1883 is therefore inhibition of LOC170063 (Accession XM\_104820). Accordingly, utilities of VGAM1883 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170063. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1884 (VGAM1884) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62358] VGAM1884 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1884 was detected is described hereinabove with reference to Figs. 1–8.

[62359] VGAM1884 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Respiratory Syncytial Virus. VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62360] VGAM1884 gene encodes a VGAM1884 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1884 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1884 precursor RNA is designated SEQ ID:1870, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1870 is located at position 8134 relative to the genome of Bovine Respiratory Syncytial Virus.

[62361] VGAM1884 precursor RNA folds onto itself, forming

VGAM1884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62362] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1884 folded precursor RNA into VGAM1884 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1884 RNA is designated SEQ ID:4595, and is provided hereinbelow with reference to the sequence listing part.

[62363] VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1884 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62364] VGAM1884 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1884 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1884 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62365] The complementary binding of VGAM1884 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1884 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1884 host target RNA into VGAM1884 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62366] It is appreciated that VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1884 host target genes. The mRNA of each one of this plurality of VGAM1884 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1884 RNA, herein designated VGAM RNA, and which when bound by VGAM1884 RNA causes inhibition of translation of respective one or more VGAM1884 host target proteins.

[62367] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1884 gene, herein designated VGAM GENE, on one or more VGAM1884 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62368] It is yet further appreciated that a function of VGAM1884 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of viral infection by Bovine Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1884 correlate with, and may be deduced from, the identity of the host target genes which VGAM1884 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62369] Nucleotide sequences of the VGAM1884 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1884 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1884 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1884 are further described hereinbelow with reference to Table 1.

[62370] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1884 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1884 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62371] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1884 gene, herein designated VGAM is inhibition of expression of VGAM1884 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1884 correlate with, and may be deduced from, the identity of the target genes which VGAM1884 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[62372] 5-methyltetrahydrofolate-homocysteine Methyltransferase Reductase (MTRR, Accession NM\_024010) is a VGAM1884 host target gene. MTRR BINDING SITE1 and MTRR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MTRR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTRR BINDING SITE1 and MTRR BINDING SITE2, designated SEQ ID:23444 and SEQ ID:8290 respectively, to the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, also designated SEQ ID:4595.

[62373] A function of VGAM1884 is therefore inhibition of 5-methyltetrahydrofolate-homocysteine Methyltransferase Reductase (MTRR, Accession NM\_024010). Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTRR. Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM\_002734) is another VGAM1884 host target gene. PRKAR1A BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by PRKAR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR1A BINDING SITE, designated SEQ ID:8605, to the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, also designated SEQ ID:4595.

[62374] Another function of VGAM1884 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM\_002734). Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR1A. Protein Kinase C, Nu (PRKCN, Accession NM\_005813) is another VGAM1884 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:12395, to the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4595.

[62375] Another function of VGAM1884 is therefore inhibition of Protein Kinase C,  $\alpha$  (PRKCN, Accession NM\_005813). Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. RINZF (Accession NM\_023929) is another VGAM1884 host target gene. RINZF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RINZF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RINZF BINDING SITE, designated SEQ ID:23411, to the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, also designated SEQ ID:4595.

[62376] Another function of VGAM1884 is therefore inhibition of RINZF (Accession NM\_023929). Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RINZF. LOC143692 (Accession XM\_084601) is another VGAM1884 host target gene. LOC143692 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143692, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143692 BINDING SITE, designated SEQ ID:37630, to the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, also designated SEQ ID:4595.

[62377] Another function of VGAM1884 is therefore inhibition of LOC143692 (Accession XM\_084601). Accordingly, utilities of VGAM1884 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143692. LOC158549 (Accession XM\_098963) is another VGAM1884 host target gene. LOC158549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:42004, to the nucleotide sequence of VGAM1884 RNA, herein designated VGAM RNA, also designated SEQ ID:4595.

[62378] Another function of VGAM1884 is therefore inhibition of LOC158549 (Accession XM\_098963). Accordingly, utilities of VGAM1884 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC158549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1885 (VGAM1885) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62379] VGAM1885 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1885 was detected is described hereinabove with reference to Figs. 1–8.

[62380] VGAM1885 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62381] VGAM1885 gene encodes a VGAM1885 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1885 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1885 precursor RNA is desig-

nated SEQ ID:1871, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1871 is located at position 363 relative to the genome of Newcastle Disease Virus.

- [62382] VGAM1885 precursor RNA folds onto itself, forming VGAM1885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62383] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1885 folded precursor RNA into VGAM1885 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1885 RNA is designated SEQ ID:4596, and is provided hereinbelow with reference to the sequence

listing part.

[62384] VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1885 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62385] VGAM1885 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1885 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1885 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62386] The complementary binding of VGAM1885 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1885 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1885 host target RNA into VGAM1885 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62387] It is appreciated that VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1885 host target genes. The mRNA of each one of this plurality of VGAM1885 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1885 RNA, herein designated VGAM

RNA, and which when bound by VGAM1885 RNA causes inhibition of translation of respective one or more VGAM1885 host target proteins.

[62388] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1885 gene, herein designated VGAM GENE, on one or more VGAM1885 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62389] It is yet further appreciated that a function of VGAM1885 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1885 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1885 correlate with, and may be deduced from, the identity of the host target genes which VGAM1885 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62390] Nucleotide sequences of the VGAM1885 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1885 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1885 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1885 are further described hereinbelow with reference to Table 1.

[62391] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1885 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1885 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62392] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1885 gene, herein designated VGAM is

inhibition of expression of VGAM1885 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1885 correlate with, and may be deduced from, the identity of the target genes which VGAM1885 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62393] B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A, Accession NM\_138553) is a VGAM1885 host target gene. BCL11A BINDING SITE1 and BCL11A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCL11A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11A BINDING SITE1 and BCL11A BINDING SITE2, designated SEQ ID:28851 and SEQ ID:19751 respectively, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62394] A function of VGAM1885 is therefore inhibition of B-cell CLL/lymphoma 11A (zinc finger protein) (BCL11A, Accession NM\_138553), a gene which acts as a transcriptional repressor. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with BCL11A. The function of BCL11A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM190.BTG Family, Member 2 (BTG2, Accession NM\_006763) is another VGAM1885 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13620, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62395] Another function of VGAM1885 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM\_006763). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM\_001408) is another VGAM1885 host target gene. CELSR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CELSR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR2 BINDING SITE, designated SEQ ID:7108, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62396] Another function of VGAM1885 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM\_001408), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR2. The function of CELSR2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM432. Centrin, EF-hand Protein, 1 (CETN1, Accession XM\_170866) is another VGAM1885 host target gene. CETN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CETN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CETN1 BINDING SITE, designated SEQ ID:45639, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62397] Another function of VGAM1885 is therefore inhibition of Centrin, EF-hand Protein, 1 (CETN1, Accession XM\_170866). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CETN1. LIM Domain Only 4 (LMO4, Accession NM\_006769) is another VGAM1885 host target gene. LMO4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LMO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO4 BINDING SITE, designated SEQ ID:13643, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62398] Another function of VGAM1885 is therefore inhibition of LIM Domain Only 4 (LMO4, Accession NM\_006769), a gene which promotes myogenic differentiation. Accordingly,

utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO4. The function of LMO4 has been established by previous studies. Muscle development is a complex, multistep process under the control of both ubiquitous and muscle-specific transcriptional regulators. Arber et al. (1994) described a positive regulator of myogenesis that was cloned from a subtracted cDNA library enriched for messages induced in denervated rat skeletal muscle. The rat cDNA was designated muscle LIM protein (Mlp) because it contained a cysteine-rich domain originally described in the 3 proteins Lin-11, Isl-1 (OMIM Ref. No. 600366), and Mec-3. Mlp is enriched in striated muscle and its expression coincides with myogenic differentiation. In the absence of Mlp, induced myoblasts express myogenin but fail to exit the cell cycle and differentiate. The rat Mlp cDNA encodes a predicted 194-amino acid protein containing 2 LIM motifs. The protein is highly conserved and Northern blots detected transcripts in chicken and Drosophila, from which the corresponding genes were isolated. The chicken and rat proteins are 93% identical. Fung et al. (1995) cloned a human cDNA, which they designated cardiac LIM protein (CLP), whose deduced

amino acid sequence is 95% identical to that of rat Mlp. The authors proposed that the human gene is the homolog of the rat sequence. Northern blots showed expression in cardiac and slow-twitch skeletal muscles

[62399] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[62400] Arber, S.; Halder, G.; Caroni, P. : Muscle LIM protein, a novel essential regulator of myogenesis, promotes myogenic differentiation. *Cell* 79: 221-231, 1994. ; and

[62401] Weiskirchen, R.; Pino, J. D.; Macalma, T.; Bister, K.; Beckerle, M. C. : The cysteine-rich protein family of highly related LIM domain proteins. *J. Biol. Chem.* 270: 28946-28954, 1995.

[62402] Further studies establishing the function and utilities of LMO4 are found in John Hopkins OMIM database record ID 600824, and in cited publications numbered 7775-777 and 3980 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase Kinase Kinase 1 (MAP3K1, Accession XM\_042066) is another VGAM1885 host target gene. MAP3K1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by MAP3K1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K1 BINDING SITE, designated SEQ ID:33680, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62403] Another function of VGAM1885 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 1 (MAP3K1, Accession XM\_042066), a gene which can phosphorylate and activate mapkk 1 and mapkk 2 (mek1/mek2) which leads to phosphorylation of map kinases. it is also a highly efficient activator of the jnk cascade. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K1. The function of MAP3K1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM469. MAX Binding Protein (MNT, Accession NM\_020310) is another VGAM1885 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MNT, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21566, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62404] Another function of VGAM1885 is therefore inhibition of MAX Binding Protein (MNT, Accession NM\_020310). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Membrane Protein, Palmitoylated 5 (MAGUK p55 subfamily member 5) (MPP5, Accession NM\_022474) is another VGAM1885 host target gene. MPP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP5 BINDING SITE, designated SEQ ID:22839, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62405] Another function of VGAM1885 is therefore inhibition of Membrane Protein, Palmitoylated 5 (MAGUK p55 subfamily

member 5) (MPP5, Accession NM\_022474), a gene which may regulate transmembrane proteins that bind calcium, calmodulin, or nucleotides. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP5. The function of MPP5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM306. Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310) is another VGAM1885 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:12999, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62406] Another function of VGAM1885 is therefore inhibition of Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Ac-

cordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS. The function of NPEPPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83. RNTRE (Accession NM\_014688) is another VGAM1885 host target gene. RNTRE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNTRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNTRE BINDING SITE, designated SEQ ID:16188, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62407] Another function of VGAM1885 is therefore inhibition of RNTRE (Accession NM\_014688), a gene which may be involved in cell proliferation. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNTRE. The function of RNTRE and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM379.Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM\_006922) is another VGAM1885 host target gene. SCN3A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SCN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN3A BINDING SITE, designated SEQ ID:13795, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62408] Another function of VGAM1885 is therefore inhibition of Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM\_006922), a gene which may be important for maintaining neural membrane excitability. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN3A. The function of SCN3A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM124.Solute Carrier Family 4, Sodium Bicarbonate Cotransporter,

Member 4 (SLC4A4, Accession NM\_003759) is another VGAM1885 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:9837, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62409] Another function of VGAM1885 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM\_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222. Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385) is another VGAM1885 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:17687, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62410] Another function of VGAM1885 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM\_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM475. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362) is another VGAM1885 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5932, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62411] Another function of VGAM1885 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. CMG2 (Accession NM\_058172) is another VGAM1885 host target gene. CMG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CMG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMG2 BINDING SITE, designated SEQ ID:27719, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62412] Another function of VGAM1885 is therefore inhibition of CMG2 (Accession NM\_058172). Accordingly, utilities of

VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM\_014787) is another VGAM1885 host target gene. DNAJC6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAJC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC6 BINDING SITE, designated SEQ ID:16662, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62413] Another function of VGAM1885 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 6 (DNAJC6, Accession NM\_014787). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC6. FLJ20291 (Accession NM\_017748) is another VGAM1885 host target gene. FLJ20291 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20291 BINDING SITE, designated SEQ ID:19342, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62414] Another function of VGAM1885 is therefore inhibition of FLJ20291 (Accession NM\_017748). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20291. FLJ21870 (Accession NM\_023016) is another VGAM1885 host target gene. FLJ21870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21870 BINDING SITE, designated SEQ ID:23278, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62415] Another function of VGAM1885 is therefore inhibition of FLJ21870 (Accession NM\_023016). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ21870. IMP-2 (Accession NM\_006548) is another VGAM1885 host target gene. IMP-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMP-2 BINDING SITE, designated SEQ ID:13306, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62416] Another function of VGAM1885 is therefore inhibition of IMP-2 (Accession NM\_006548). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMP-2. KIAA0628 (Accession NM\_014789) is another VGAM1885 host target gene. KIAA0628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:16675, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4596.

[62417] Another function of VGAM1885 is therefore inhibition of KIAA0628 (Accession NM\_014789). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0628. KIAA0737 (Accession NM\_014828) is another VGAM1885 host target gene. KIAA0737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0737 BINDING SITE, designated SEQ ID:16816, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62418] Another function of VGAM1885 is therefore inhibition of KIAA0737 (Accession NM\_014828). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0737. KIAA0820 (Accession XM\_044463) is another VGAM1885 host target gene. KIAA0820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0820, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0820 BINDING SITE, designated SEQ ID:34219, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62419] Another function of VGAM1885 is therefore inhibition of KIAA0820 (Accession XM\_044463). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0820. KIAA1128 (Accession XM\_043596) is another VGAM1885 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33970, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62420] Another function of VGAM1885 is therefore inhibition of KIAA1128 (Accession XM\_043596). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1128. KIAA1450 (Accession XM\_038035) is another VGAM1885 host target gene. KIAA1450 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1450 BINDING SITE, designated SEQ ID:32747, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62421] Another function of VGAM1885 is therefore inhibition of KIAA1450 (Accession XM\_038035). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1450. KIAA1641 (Accession XM\_087167) is another VGAM1885 host target gene. KIAA1641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1641 BINDING SITE, designated SEQ ID:39098, to the

nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62422] Another function of VGAM1885 is therefore inhibition of KIAA1641 (Accession XM\_087167). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1641. KIAA1713 (Accession XM\_051335) is another VGAM1885 host target gene. KIAA1713 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1713 BINDING SITE, designated SEQ ID:35810, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62423] Another function of VGAM1885 is therefore inhibition of KIAA1713 (Accession XM\_051335). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1713. KIAA1944 (Accession XM\_062545) is another VGAM1885 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37224, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62424] Another function of VGAM1885 is therefore inhibition of KIAA1944 (Accession XM\_062545). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. MGC26954 (Accession NM\_145025) is another VGAM1885 host target gene. MGC26954 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC26954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26954 BINDING SITE, designated SEQ ID:29638, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62425] Another function of VGAM1885 is therefore inhibition of MGC26954 (Accession NM\_145025). Accordingly, utilities

of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26954. Mitochondrial Ribosomal Protein 63 (MRP63, Accession NM\_024026) is another VGAM1885 host target gene. MRP63 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRP63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRP63 BINDING SITE, designated SEQ ID:23455, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62426] Another function of VGAM1885 is therefore inhibition of Mitochondrial Ribosomal Protein 63 (MRP63, Accession NM\_024026). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRP63. Placenta-specific 3 (PLAC3, Accession XM\_045115) is another VGAM1885 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34367, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62427] Another function of VGAM1885 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM\_045115). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. Phospholipid Scramblase 2 (PLSCR2, Accession NM\_020359) is another VGAM1885 host target gene. PLSCR2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLSCR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLSCR2 BINDING SITE, designated SEQ ID:21631, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62428] Another function of VGAM1885 is therefore inhibition of Phospholipid Scramblase 2 (PLSCR2, Accession NM\_020359). Accordingly, utilities of VGAM1885 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PLSCR2. PTD002 (Accession NM\_016144) is another VGAM1885 host target gene.

PTD002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTD002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD002 BINDING SITE, designated SEQ ID:18229, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62429] Another function of VGAM1885 is therefore inhibition of PTD002 (Accession NM\_016144). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD002. RAP140 (Accession NM\_015224) is another VGAM1885 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140

BINDING SITE, designated SEQ ID:17558, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62430] Another function of VGAM1885 is therefore inhibition of RAP140 (Accession NM\_015224). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. RNO2 (Accession NM\_033297) is another VGAM1885 host target gene. RNO2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNO2 BINDING SITE, designated SEQ ID:27126, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62431] Another function of VGAM1885 is therefore inhibition of RNO2 (Accession NM\_033297). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNO2. TACTILE (Accession NM\_005816) is another VGAM1885 host target gene. TACTILE BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by TACTILE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACTILE BINDING SITE, designated SEQ ID:12413, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62432] Another function of VGAM1885 is therefore inhibition of TACTILE (Accession NM\_005816). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACTILE. LOC115073 (Accession XM\_055193) is another VGAM1885 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36241, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62433] Another function of VGAM1885 is therefore inhibition of

LOC115073 (Accession XM\_055193). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC116123 (Accession NM\_138784) is another VGAM1885 host target gene. LOC116123 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC116123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116123 BINDING SITE, designated SEQ ID:29013, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62434] Another function of VGAM1885 is therefore inhibition of LOC116123 (Accession NM\_138784). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116123. LOC125929 (Accession XM\_064872) is another VGAM1885 host target gene. LOC125929 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125929, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC125929 BINDING SITE, designated SEQ ID:37267, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62435] Another function of VGAM1885 is therefore inhibition of LOC125929 (Accession XM\_064872). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125929. LOC142927 (Accession XM\_084380) is another VGAM1885 host target gene. LOC142927 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142927 BINDING SITE, designated SEQ ID:37568, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62436] Another function of VGAM1885 is therefore inhibition of LOC142927 (Accession XM\_084380). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142927. LOC144893 (Accession XM\_096687) is an-

other VGAM1885 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40460, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62437] Another function of VGAM1885 is therefore inhibition of LOC144893 (Accession XM\_096687). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC145622 (Accession XM\_085186) is another VGAM1885 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37904, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62438] Another function of VGAM1885 is therefore inhibition of LOC145622 (Accession XM\_085186). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. LOC148811 (Accession XM\_086326) is another VGAM1885 host target gene. LOC148811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:38599, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62439] Another function of VGAM1885 is therefore inhibition of LOC148811 (Accession XM\_086326). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148811. LOC158156 (Accession XM\_088496) is another VGAM1885 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158156 BINDING SITE, designated SEQ ID:39742, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62440] Another function of VGAM1885 is therefore inhibition of LOC158156 (Accession XM\_088496). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. LOC50999 (Accession NM\_016040) is another VGAM1885 host target gene. LOC50999 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC50999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC50999 BINDING SITE, designated SEQ ID:18114, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62441] Another function of VGAM1885 is therefore inhibition of LOC50999 (Accession NM\_016040). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC50999. LOC91151 (Accession NM\_033208) is another VGAM1885 host target gene. LOC91151 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91151 BINDING SITE, designated SEQ ID:27054, to the nucleotide sequence of VGAM1885 RNA, herein designated VGAM RNA, also designated SEQ ID:4596.

[62442] Another function of VGAM1885 is therefore inhibition of LOC91151 (Accession NM\_033208). Accordingly, utilities of VGAM1885 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91151. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1886 (VGAM1886) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62443] VGAM1886 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1886 was detected is described hereinabove with reference to Figs. 1–8.

[62444] VGAM1886 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62445] VGAM1886 gene encodes a VGAM1886 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1886 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1886 precursor RNA is designated SEQ ID:1872, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1872 is located at position 7875 relative to the genome of Newcastle Disease Virus.

[62446] VGAM1886 precursor RNA folds onto itself, forming VGAM1886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62447] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1886 folded precursor RNA into VGAM1886 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1886 RNA is designated SEQ ID:4597, and is provided hereinbelow with reference to the sequence listing part.

[62448] VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1886 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62449] VGAM1886 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1886 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1886 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[62450] The complementary binding of VGAM1886 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1886 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1886 host target RNA into VGAM1886 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62451] It is appreciated that VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1886 host target genes. The mRNA of each one of this plurality of VGAM1886 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1886 RNA, herein designated VGAM RNA, and which when bound by VGAM1886 RNA causes inhibition of translation of respective one or more VGAM1886 host target proteins.

[62452] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1886 gene, herein designated VGAM GENE, on one or more VGAM1886 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62453] It is yet further appreciated that a function of VGAM1886 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1886 correlate with, and may be deduced from, the identity of the host target genes which VGAM1886 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62454] Nucleotide sequences of the VGAM1886 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1886 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1886 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1886 are further described hereinbelow with reference to Table 1.

[62455] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1886 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1886 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62456] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1886 gene, herein designated VGAM is inhibition of expression of VGAM1886 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1886 correlate with, and may be deduced from, the identity of the target genes which VGAM1886 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62457] Cadherin Related 23 (CDH23, Accession NM\_022124) is a VGAM1886 host target gene. CDH23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH23, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH23 BINDING SITE, designated SEQ ID:22668, to the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, also designated SEQ ID:4597.

[62458] A function of VGAM1886 is therefore inhibition of Cadherin Related 23 (CDH23, Accession NM\_022124). Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH23. TNF Receptor-associated Factor 1 (TRAF1, Accession NM\_005658) is another VGAM1886 host target gene. TRAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF1 BINDING SITE, designated SEQ ID:12200, to the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, also designated SEQ ID:4597.

[62459] Another function of VGAM1886 is therefore inhibition of TNF Receptor-associated Factor 1 (TRAF1, Accession

NM\_005658), a gene which signal transducer associated with the cytoplasmic domain of the 75 kda tumor necrosis factor receptor (tnf-r2). Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF1. The function of TRAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. KIAA0893 (Accession NM\_014969) is another VGAM1886 host target gene. KIAA0893 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0893 BINDING SITE, designated SEQ ID:17360, to the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, also designated SEQ ID:4597.

[62460] Another function of VGAM1886 is therefore inhibition of KIAA0893 (Accession NM\_014969). Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0893. LOC203350 (Accession XM\_117536) is another

VGAM1886 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43531, to the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, also designated SEQ ID:4597.

[62461] Another function of VGAM1886 is therefore inhibition of LOC203350 (Accession XM\_117536). Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC254413 (Accession XM\_173141) is another VGAM1886 host target gene. LOC254413 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254413 BINDING SITE, designated SEQ ID:46395, to the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, also designated SEQ ID:4597.

[62462] Another function of VGAM1886 is therefore inhibition of LOC254413 (Accession XM\_173141). Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254413. LOC93017 (Accession XM\_048772) is another VGAM1886 host target gene. LOC93017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93017 BINDING SITE, designated SEQ ID:35253, to the nucleotide sequence of VGAM1886 RNA, herein designated VGAM RNA, also designated SEQ ID:4597.

[62463] Another function of VGAM1886 is therefore inhibition of LOC93017 (Accession XM\_048772). Accordingly, utilities of VGAM1886 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1887 (VGAM1887) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[62464] VGAM1887 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1887 was detected is described hereinabove with reference to Figs. 1–8.

[62465] VGAM1887 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62466] VGAM1887 gene encodes a VGAM1887 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1887 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1887 precursor RNA is designated SEQ ID:1873, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1873 is located at position 4276 relative to the genome of Newcastle Disease Virus.

[62467] VGAM1887 precursor RNA folds onto itself, forming VGAM1887 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62468] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1887 folded precursor RNA into VGAM1887 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM1887 RNA is designated SEQ ID:4598, and is provided hereinbelow with reference to the sequence listing part.

[62469] VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1887 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62470] VGAM1887 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1887 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1887 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62471] The complementary binding of VGAM1887 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1887 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1887 host target RNA into VGAM1887 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62472] It is appreciated that VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1887 host target genes. The mRNA of each one of this plurality of VGAM1887 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1887 RNA, herein designated VGAM RNA, and which when bound by VGAM1887 RNA causes inhibition of translation of respective one or more VGAM1887 host target proteins.

[62473] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1887 gene, herein designated VGAM GENE, on one or more VGAM1887 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62474] It is yet further appreciated that a function of VGAM1887 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1887 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1887 correlate with, and may be deduced from, the identity of the host target genes which VGAM1887 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[62475] Nucleotide sequences of the VGAM1887 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1887 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1887 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1887 are further described hereinbelow with reference to Table 1.

[62476] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1887 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1887 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62477] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1887 gene, herein designated VGAM is inhibition of expression of VGAM1887 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1887 correlate with, and may be deduced from, the identity of the target genes which VGAM1887 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62478] GATA Binding Protein 2 (GATA2, Accession NM\_002050) is a VGAM1887 host target gene. GATA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:7802, to the nucleotide sequence of VGAM1887 RNA, herein designated VGAM RNA, also designated SEQ ID:4598.

[62479] A function of VGAM1887 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM\_002050). Accordingly, utilities of VGAM1887 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. MGC2306 (Accession NM\_032638) is another VGAM1887 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26351, to the nucleotide sequence of VGAM1887 RNA,

herein designated VGAM RNA, also designated SEQ ID:4598.

[62480] Another function of VGAM1887 is therefore inhibition of MGC2306 (Accession NM\_032638). Accordingly, utilities of VGAM1887 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1888 (VGAM1888) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62481] VGAM1888 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1888 was detected is described hereinabove with reference to Figs. 1–8.

[62482] VGAM1888 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62483] VGAM1888 gene encodes a VGAM1888 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1888 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1888 precursor RNA is designated SEQ ID:1874, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1874 is located at position 12826 relative to the genome of Newcastle Disease Virus.

- [62484] VGAM1888 precursor RNA folds onto itself, forming VGAM1888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62485] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1888 folded precursor RNA into VGAM1888 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1888 RNA is designated SEQ ID:4599, and is provided hereinbelow with reference to the sequence listing part.

[62486] VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1888 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62487] VGAM1888 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1888 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1888 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62488] The complementary binding of VGAM1888 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1888 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1888 host target RNA into VGAM1888 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62489] It is appreciated that VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1888 host target genes. The mRNA of each one of this plurality of VGAM1888 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1888 RNA, herein designated VGAM RNA, and which when bound by VGAM1888 RNA causes inhibition of translation of respective one or more VGAM1888 host target proteins.

[62490] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1888 gene, herein designated VGAM GENE, on one or more VGAM1888 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[62491] It is yet further appreciated that a function of VGAM1888 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1888 correlate with, and may be deduced from, the identity of the host target genes which VGAM1888 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62492] Nucleotide sequences of the VGAM1888 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1888 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1888 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1888 are further described hereinbelow with reference to Table 1.

[62493] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1888 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1888 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62494] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1888 gene, herein designated VGAM is inhibition of expression of VGAM1888 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1888 correlate with, and may be deduced from, the identity of the target genes which VGAM1888 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62495] CD69 Antigen (p60, early T-cell activation antigen) (CD69, Accession NM\_001781) is a VGAM1888 host target gene. CD69 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD69, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD69 BINDING SITE, designated SEQ ID:7538, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62496] A function of VGAM1888 is therefore inhibition of CD69 Antigen (p60, early T-cell activation antigen) (CD69, Ac-

cession NM\_001781), a gene which is involved in lymphocyte proliferation and functions as a signal transmitting receptor. Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD69. The function of CD69 has been established by previous studies. The activation of T lymphocytes, both in vivo and in vitro, induces the expression of CD69. This molecule, which appears to be the earliest inducible cell surface glycoprotein acquired during lymphoid activation, is involved in lymphocyte proliferation and functions as a signal transmitting receptor in lymphocytes, natural killer (NK) cells, and platelets. Cambiaggi et al. (1992) produced and characterized interspecies somatic cell hybrids between human activated mature T cells and mouse BW5147 thymoma cells. A preferential segregation of human chromosomes was observed in the hybrids. They found in clones a coexpression of CD4 and CD69 antigens. Molecular and karyotypic studies of the hybrids demonstrated that the locus encoding CD69 maps to human chromosome 12 as does that for CD4 (OMIM Ref. No. 186940). Although the expression of CD69 antigen is an early event after T-lymphocyte activation and rapidly declines in the absence of exogenous

stimuli, in the hybrids they developed the expression was constitutive, similar to what is found in early thymocyte precursors and mature thymocytes. The finding suggested a dominant influence of the thymus-derived mouse tumor cell genome in controlling the constitutive expression of CD69. Lopez-Cabrera et al. (1993) demonstrated that a cDNA for CD69 showed a single open reading frame of 597 bp, predicting a 199-amino acid protein of type II membrane topology. The CD69 clone hybridized to a 1.7-kb mRNA species, which was rapidly induced and degraded after lymphocyte stimulation, consistent with the presence of rapid degradation signals at the 3-prime untranslated region. By somatic cell hybrid DNA analysis and fluorescence in situ hybridization, Lopez-Cabrera et al. (1993) assigned the CD69 gene to 12p13-p12. Protein sequence homology search demonstrated that CD69 is a member of the same superfamily of type II transmembrane receptors as natural killer cell lectin (NKG2; 161555), which also maps to chromosome 12.

[62497] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[62498] Cambiaggi, C.; Scupoli, M. T.; Cestari, T.; Gerosa, F.;

Carra, G.; Tridente, G.; Accolla, R. S. : Constitutive expression of CD69 in interspecies T-cell hybrids and locus assignment to human chromosome 12. Immunogenetics 36: 117-120, 1992. ; and

[62499] Lopez-Cabrera, M.; Santis, A. G.; Fernandez-Ruiz, E.; Blacher, R.; Esch, F.; Sanchez-Mateos, P.; Sanchez-Madrid, F. : Molecular cloning, expression, and chromosomal localization of the.

[62500] Further studies establishing the function and utilities of CD69 are found in John Hopkins OMIM database record ID 107273, and in cited publications numbered 12426-12427 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CAT56 (Accession NM\_025263) is another VGAM1888 host target gene. CAT56 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAT56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT56 BINDING SITE, designated SEQ ID:24931, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62501] Another function of VGAM1888 is therefore inhibition of CAT56 (Accession NM\_025263). Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT56. FLJ20527 (Accession NM\_017863) is another VGAM1888 host target gene. FLJ20527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20527 BINDING SITE, designated SEQ ID:19541, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62502] Another function of VGAM1888 is therefore inhibition of FLJ20527 (Accession NM\_017863). Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20527. G Protein-coupled Receptor 105 (GPR105, Accession NM\_014879) is another VGAM1888 host target gene. GPR105 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR105, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR105 BINDING SITE, designated SEQ ID:17021, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62503] Another function of VGAM1888 is therefore inhibition of G Protein-coupled Receptor 105 (GPR105, Accession NM\_014879). Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR105. LOC144893 (Accession XM\_096687) is another VGAM1888 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40463, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62504] Another function of VGAM1888 is therefore inhibition of LOC144893 (Accession XM\_096687). Accordingly, utilities

of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC170261 (Accession XM\_093214) is another VGAM1888 host target gene. LOC170261 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC170261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170261 BINDING SITE, designated SEQ ID:40184, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62505] Another function of VGAM1888 is therefore inhibition of LOC170261 (Accession XM\_093214). Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170261. LOC257051 (Accession XM\_172800) is another VGAM1888 host target gene. LOC257051 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC257051 BINDING SITE, designated SEQ ID:46084, to the nucleotide sequence of VGAM1888 RNA, herein designated VGAM RNA, also designated SEQ ID:4599.

[62506] Another function of VGAM1888 is therefore inhibition of LOC257051 (Accession XM\_172800). Accordingly, utilities of VGAM1888 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257051. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1889 (VGAM1889) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62507] VGAM1889 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1889 was detected is described hereinabove with reference to Figs. 1–8.

[62508] VGAM1889 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62509] VGAM1889 gene encodes a VGAM1889 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1889 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1889 precursor RNA is designated SEQ ID:1875, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1875 is located at position 48 relative to the genome of Newcastle Disease Virus.

[62510] VGAM1889 precursor RNA folds onto itself, forming VGAM1889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62511] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1889 folded precursor RNA into VGAM1889 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1889 RNA is designated SEQ ID:4600, and is provided hereinbelow with reference to the sequence listing part.

[62512] VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1889 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62513] VGAM1889 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1889 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1889 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62514] The complementary binding of VGAM1889 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1889 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1889 host target RNA into VGAM1889 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62515] It is appreciated that VGAM1889 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1889 host target genes. The mRNA of each one of this plurality of VGAM1889 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1889 RNA, herein designated VGAM RNA, and which when bound by VGAM1889 RNA causes inhibition of translation of respective one or more VGAM1889 host target proteins.

[62516] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1889 gene, herein designated VGAM GENE, on one or more VGAM1889 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[62517] It is yet further appreciated that a function of VGAM1889 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1889 correlate with, and may be deduced from, the identity of the host target genes which VGAM1889 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62518] Nucleotide sequences of the VGAM1889 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1889 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1889 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1889 are further described hereinbelow with reference to Table 1.

[62519] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1889 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1889 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62520] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1889 gene, herein designated VGAM is inhibition of expression of VGAM1889 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1889 correlate with, and may be deduced from, the identity of the target genes which VGAM1889 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62521] Plexin A2 (PLXNA2, Accession NM\_025179) is a VGAM1889 host target gene. PLXNA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLXNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA2 BINDING SITE, designated SEQ ID:24813, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62522] A function of VGAM1889 is therefore inhibition of Plexin

A2 (PLXNA2, Accession NM\_025179), a gene which is a transmembrane protein. Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNA2. The function of PLXNA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538. Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 8 (SLC7A8, Accession NM\_012244) is another VGAM1889 host target gene. SLC7A8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC7A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A8 BINDING SITE, designated SEQ ID:14550, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62523] Another function of VGAM1889 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 8 (SLC7A8, Accession NM\_012244), a gene which helps mediate transport of large and small

neutral amino acids. Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A8. The function of SLC7A8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1263.DKFZP434F091 (Accession NM\_015453) is another VGAM1889 host target gene. DKFZP434F091 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434F091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F091 BINDING SITE, designated SEQ ID:17736, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62524] Another function of VGAM1889 is therefore inhibition of DKFZP434F091 (Accession NM\_015453). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434F091. FLJ13111 (Accession NM\_025082) is another VGAM1889 host target gene. FLJ13111 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13111 BINDING SITE, designated SEQ ID:24684, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62525] Another function of VGAM1889 is therefore inhibition of FLJ13111 (Accession NM\_025082). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13111. FLJ20312 (Accession NM\_017761) is another VGAM1889 host target gene. FLJ20312 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20312 BINDING SITE, designated SEQ ID:19373, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62526] Another function of VGAM1889 is therefore inhibition of

FLJ20312 (Accession NM\_017761). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20312. KIAA0776 (Accession XM\_035970) is another VGAM1889 host target gene. KIAA0776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0776 BINDING SITE, designated SEQ ID:32362, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62527] Another function of VGAM1889 is therefore inhibition of KIAA0776 (Accession XM\_035970). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0776. KIAA1040 (Accession XM\_051091) is another VGAM1889 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35738, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62528] Another function of VGAM1889 is therefore inhibition of KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1956 (Accession XM\_085836) is another VGAM1889 host target gene. KIAA1956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1956 BINDING SITE, designated SEQ ID:38361, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62529] Another function of VGAM1889 is therefore inhibition of KIAA1956 (Accession XM\_085836). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1956. Mitogen-activated Protein Kinase Kinase Ki-

nase 2 (MAP3K2, Accession NM\_006609) is another VGAM1889 host target gene. MAP3K2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:13384, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62530] Another function of VGAM1889 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2. Phospholipase A2, Group XII (PLA2G12, Accession NM\_030821) is another VGAM1889 host target gene. PLA2G12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G12 BINDING SITE, designated SEQ

ID:25151, to the nucleotide sequence of VGAM1889 RNA, herein designated VGAM RNA, also designated SEQ ID:4600.

[62531] Another function of VGAM1889 is therefore inhibition of Phospholipase A2, Group XII (PLA2G12, Accession NM\_030821). Accordingly, utilities of VGAM1889 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G12. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1890 (VGAM1890) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62532] VGAM1890 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1890 was detected is described hereinabove with reference to Figs. 1–8.

[62533] VGAM1890 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62534] VGAM1890 gene encodes a VGAM1890 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1890 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1890 precursor RNA is designated SEQ ID:1876, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1876 is located at position 14381 relative to the genome of Newcastle Disease Virus.

[62535] VGAM1890 precursor RNA folds onto itself, forming VGAM1890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62536] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1890 folded precursor RNA into VGAM1890 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1890 RNA is designated SEQ ID:4601, and is provided hereinbelow with reference to the sequence listing part.

[62537] VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1890 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62538] VGAM1890 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1890 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1890 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62539] The complementary binding of VGAM1890 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1890 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1890 host target RNA into VGAM1890 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62540] It is appreciated that VGAM1890 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1890 host target genes. The mRNA of each one of this plurality of VGAM1890 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1890 RNA, herein designated VGAM RNA, and which when bound by VGAM1890 RNA causes inhibition of translation of respective one or more VGAM1890 host target proteins.

[62541] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1890 gene, herein designated VGAM GENE, on one or more VGAM1890 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[62542] It is yet further appreciated that a function of VGAM1890 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1890 correlate with, and may be deduced from, the identity of the host target genes which VGAM1890 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62543] Nucleotide sequences of the VGAM1890 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1890 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1890 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1890 are further described hereinbelow with reference to Table 1.

[62544] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1890 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1890 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62545] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1890 gene, herein designated VGAM is inhibition of expression of VGAM1890 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1890 correlate with, and may be deduced from, the identity of the target genes which VGAM1890 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62546] Protein Kinase, Interferon-inducible Double Stranded RNA Dependent (PRKR, Accession NM\_002759) is a VGAM1890 host target gene. PRKR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRKR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKR BINDING SITE, designated SEQ ID:8645, to the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, also designated SEQ ID:4601.

[62547] A function of VGAM1890 is therefore inhibition of Protein Kinase, Interferon-inducible Double Stranded RNA Dependent (PRKR, Accession NM\_002759), a gene which catalyzes the phosphorylation of the alpha subunit of eIF2. Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKR. The function of PRKR has been established by previous studies. Ben-Asouli et al. (2002) showed that human gamma-interferon (IFNG; 147570) mRNA uses local activation of PKR in the cell to control its own translation yield. IFNG mRNA was found to activate PKR through a pseudoknot in its 5-prime untranslated region. Mutations that impaired pseudoknot stability reduced the ability to activate PKR and strongly increased the translation efficiency of IFNG mRNA. Nonphosphorylatable mutant eIF2-alpha, knockout of PKR, and the PKR inhibitors 2-aminopurine, transdominant-negative PKR, or vaccinia E3L correspondingly enhanced translation of IFNG mRNA. The potential to form the pseudoknot was found to be phylogenetically conserved. Ben-Asouli et al. (2002) proposed that the RNA pseudoknot acts to adjust translation of IFNG mRNA to the PKR level expressed in the cell. Barber et al. (1993) mapped the PRKR gene to 2p21 by in

situ hybridization. The corresponding mouse gene was mapped to chromosome 17 (band E2) by the same method. Squire et al. (1993) assigned the PRKR gene to the boundary between 2p22 and 2p21 by fluorescence in situ hybridization. Taylor et al. (1999) studied the mechanism underlying the resistance of hepatitis C virus (HCV) to interferon. They demonstrated that the HCV envelope protein E2 contains a sequence identical with phosphorylation sites of the interferon-inducible protein kinase PKR and the translation initiation factor EIF2- $\alpha$ , a target of PKR. E2 inhibited the kinase activity of PKR and blocked its inhibitory effect on protein synthesis and cell growth. This interaction of E2 in PKR may be one mechanism by which HCV circumvents the antiviral effect of interferon. Taylor et al. (1999) hypothesized that another potential outcome of PKR inhibition is the promotion of cell growth which may contribute to HCV-associated hepatocellular carcinoma. Huntington disease (OMIM Ref. No. 143100) is a neurodegenerative disorder caused by a trinucleotide repeat expansion within the huntingtin gene, resulting in generation of a polyglutamine tract in the protein product. Peel et al. (2001) showed that PKR preferentially bound mutant huntingtin RNA transcripts immobilized on strep-

tavidin columns that had been incubated with human brain extracts. Immunohistochemical studies demonstrated that PKR was present in its activated form in both human Huntington autopsy material and brain tissue derived from Huntington yeast artificial chromosome transgenic mice. The increased immunolocalization of the activated kinase was more pronounced in areas most affected by the disease. The authors suggested a role for PKR activation in the Huntington disease process.

[62548] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[62549] Ben-Asouli, Y.; Banai, Y.; Pel-Or, Y.; Shir, A.; Kaempfer, R. : Human interferon-gamma mRNA autoregulates its translation through a pseudoknot that activates the interferon-inducible protein kinase PKR. Cell 108: 221-232, 2002. ; and

[62550] Peel, A. L.; Rao, R. V.; Cottrell, B. A.; Hayden, M. R.; Ellerby, L. M.; Bredesen, D. E. : Double-stranded RNA-dependent protein kinase, PKR, binds preferentially to Huntington's diseases.

[62551] Further studies establishing the function and utilities of PRKR are found in John Hopkins OMIM database record ID

176871, and in cited publications numbered 5778, 5779–5780, 602 and 10341–10343 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ14117 (Accession NM\_022777) is another VGAM1890 host target gene. FLJ14117 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14117 BINDING SITE, designated SEQ ID:23048, to the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, also designated SEQ ID:4601.

[62552] Another function of VGAM1890 is therefore inhibition of FLJ14117 (Accession NM\_022777). Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14117. KIAA1464 (Accession XM\_043069) is another VGAM1890 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33880, to the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, also designated SEQ ID:4601.

[62553] Another function of VGAM1890 is therefore inhibition of KIAA1464 (Accession XM\_043069). Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. Nuclear Receptor Subfamily 1, Group I, Member 3 (NR1I3, Accession NM\_005122) is another VGAM1890 host target gene. NR1I3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NR1I3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I3 BINDING SITE, designated SEQ ID:11606, to the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, also designated SEQ ID:4601.

[62554] Another function of VGAM1890 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 3 (NR1I3, Accession NM\_005122). Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with NR1I3. NY-REN-25 (Accession XM\_027116) is another VGAM1890 host target gene. NY-REN-25 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30418, to the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, also designated SEQ ID:4601.

[62555] Another function of VGAM1890 is therefore inhibition of NY-REN-25 (Accession XM\_027116). Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. LOC199858 (Accession XM\_114040) is another VGAM1890 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42632, to

the nucleotide sequence of VGAM1890 RNA, herein designated VGAM RNA, also designated SEQ ID:4601.

[62556] Another function of VGAM1890 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM1890 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1891 (VGAM1891) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62557] VGAM1891 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1891 was detected is described hereinabove with reference to Figs. 1–8.

[62558] VGAM1891 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62559] VGAM1891 gene encodes a VGAM1891 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1891 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1891 precursor RNA is designated SEQ ID:1877, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1877 is located at position 8373 relative to the genome of Newcastle Disease Virus.

[62560] VGAM1891 precursor RNA folds onto itself, forming VGAM1891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62561] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1891 folded precursor RNA into VGAM1891 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1891 RNA is designated SEQ ID:4602, and is provided hereinbelow with reference to the sequence listing part.

[62562] VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1891 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62563] VGAM1891 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1891 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1891 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62564] The complementary binding of VGAM1891 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1891 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1891 host target RNA into VGAM1891 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62565] It is appreciated that VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1891 host target genes. The mRNA of each one of this plurality of VGAM1891 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1891 RNA, herein designated VGAM RNA, and which when bound by VGAM1891 RNA causes inhibition of translation of respective one or more VGAM1891 host target proteins.

[62566] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1891 gene, herein designated VGAM GENE, on one or more VGAM1891 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[62567] It is yet further appreciated that a function of VGAM1891 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1891 correlate with, and may be deduced from, the identity of the host target genes which VGAM1891 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62568] Nucleotide sequences of the VGAM1891 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1891 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1891 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1891 are further described hereinbelow with reference to Table 1.

[62569] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1891 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1891 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62570] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1891 gene, herein designated VGAM is inhibition of expression of VGAM1891 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1891 correlate with, and may be deduced from, the identity of the target genes which VGAM1891 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62571] ATP10C (Accession NM\_024490) is a VGAM1891 host target gene. ATP10C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10C BINDING SITE, designated SEQ ID:23686, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62572] A function of VGAM1891 is therefore inhibition of ATP10C (Accession NM\_024490), a gene which is phosphorylated

in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10C. The function of ATP10C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM801. Collagen, Type XIII, Alpha 1 (COL13A1, Accession NM\_080799) is another VGAM1891 host target gene. COL13A1 BINDING SITE1 through COL13A1 BINDING SITE7 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL13A1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL13A1 BINDING SITE1 through COL13A1 BINDING SITE7, designated SEQ ID:28065, SEQ ID:28067, SEQ ID:28069, SEQ ID:28071, SEQ ID:28073, SEQ ID:28075 and SEQ ID:11702 respectively, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62573] Another function of VGAM1891 is therefore inhibition of Collagen, Type XIII, Alpha 1 (COL13A1, Accession

NM\_080799), a gene which is specific for basement membranes. Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL13A1. The function of COL13A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1680. KIAA0157 (Accession NM\_032182) is another VGAM1891 host target gene. KIAA0157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0157 BINDING SITE, designated SEQ ID:25896, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62574] Another function of VGAM1891 is therefore inhibition of KIAA0157 (Accession NM\_032182). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0157. KIAA1193 (Accession XM\_041843) is another VGAM1891 host target gene. KIAA1193 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33584, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62575] Another function of VGAM1891 is therefore inhibition of KIAA1193 (Accession XM\_041843). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. MGC3248 (Accession NM\_032486) is another VGAM1891 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26235, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62576] Another function of VGAM1891 is therefore inhibition of

MGC3248 (Accession NM\_032486). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. PGCP (Accession NM\_016134) is another VGAM1891 host target gene. PGCP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PGCP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGCP BINDING SITE, designated SEQ ID:18220, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62577] Another function of VGAM1891 is therefore inhibition of PGCP (Accession NM\_016134). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGCP. PRO0529 (Accession NM\_014074) is another VGAM1891 host target gene. PRO0529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PRO0529 BINDING SITE, designated SEQ ID:15297, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62578] Another function of VGAM1891 is therefore inhibition of PRO0529 (Accession NM\_014074). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0529. LOC149706 (Accession XM\_097718) is another VGAM1891 host target gene. LOC149706 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149706 BINDING SITE, designated SEQ ID:41057, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62579] Another function of VGAM1891 is therefore inhibition of LOC149706 (Accession XM\_097718). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149706. LOC152373 (Accession XM\_087449) is an-

other VGAM1891 host target gene. LOC152373 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152373 BINDING SITE, designated SEQ ID:39271, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62580] Another function of VGAM1891 is therefore inhibition of LOC152373 (Accession XM\_087449). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152373. LOC221477 (Accession XM\_166397) is another VGAM1891 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44256, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62581] Another function of VGAM1891 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC90167 (Accession XM\_029570) is another VGAM1891 host target gene. LOC90167 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90167 BINDING SITE, designated SEQ ID:30905, to the nucleotide sequence of VGAM1891 RNA, herein designated VGAM RNA, also designated SEQ ID:4602.

[62582] Another function of VGAM1891 is therefore inhibition of LOC90167 (Accession XM\_029570). Accordingly, utilities of VGAM1891 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90167. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1892 (VGAM1892) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[62583] VGAM1892 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1892 was detected is described hereinabove with reference to Figs. 1-8.

[62584] VGAM1892 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62585] VGAM1892 gene encodes a VGAM1892 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1892 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1892 precursor RNA is designated SEQ ID:1878, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1878 is located at position 13642 relative to the genome of Newcastle Disease Virus.

[62586] VGAM1892 precursor RNA folds onto itself, forming VGAM1892 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62587] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1892 folded precursor RNA into VGAM1892 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM1892 RNA is designated SEQ ID:4603, and is provided hereinbelow with reference to the sequence listing part.

[62588] VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1892 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62589] VGAM1892 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1892 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1892 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62590] The complementary binding of VGAM1892 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1892 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1892 host target RNA into VGAM1892 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62591] It is appreciated that VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1892 host target genes. The mRNA of each one of this plurality of VGAM1892 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1892 RNA, herein designated VGAM RNA, and which when bound by VGAM1892 RNA causes inhibition of translation of respective one or more VGAM1892 host target proteins.

[62592] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1892 gene, herein designated VGAM GENE, on one or more VGAM1892 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62593] It is yet further appreciated that a function of VGAM1892 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1892 correlate with, and may be deduced from, the identity of the host target genes which VGAM1892 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[62594] Nucleotide sequences of the VGAM1892 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1892 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1892 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1892 are further described hereinbelow with reference to Table 1.

[62595] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1892 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1892 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62596] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1892 gene, herein designated VGAM is inhibition of expression of VGAM1892 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1892 correlate with, and may be deduced from, the identity of the target genes which VGAM1892 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62597] Apoptotic Protease Activating Factor (APAF1, Accession NM\_001160) is a VGAM1892 host target gene. APAF1 BINDING SITE1 and APAF1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by APAF1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APAF1 BINDING SITE1 and APAF1 BINDING SITE2, designated SEQ ID:6828 and SEQ ID:14867 respectively, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62598] A function of VGAM1892 is therefore inhibition of Apoptotic Protease Activating Factor (APAF1, Accession NM\_001160), a gene which functions in the mitochondrial apoptotic pathway that leads to caspase 9 dependent activation of caspase 3. Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APAF1. The function of APAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552.Aquaporin 6, Kidney Specific (AQP6, Accession

NM\_053286) is another VGAM1892 host target gene.

AQP6 BINDING SITE1 and AQP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AQP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE1 and AQP6 BINDING SITE2, designated SEQ ID:27620 and SEQ ID:14511 respectively, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62599] Another function of VGAM1892 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM\_053286), a gene which participates in distinct physiologic function such as glomerular filtration, tubular endocytosis, and acid-base metabolism. Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340.SORCS1 (Accession NM\_052918) is another VGAM1892 host target gene. SORCS1 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SORCS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS1 BINDING SITE, designated SEQ ID:27486, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62600] Another function of VGAM1892 is therefore inhibition of SORCS1 (Accession NM\_052918). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS1. Zic Family Member 3 Heterotaxy 1 (odd-paired homolog, Drosophila) (ZIC3, Accession NM\_003413) is another VGAM1892 host target gene. ZIC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZIC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIC3 BINDING SITE, designated SEQ ID:9451, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62601] Another function of VGAM1892 is therefore inhibition of Zic Family Member 3 Heterotaxy 1 (odd-paired homolog, *Drosophila*) (ZIC3, Accession NM\_003413). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIC3. D21S2056E (Accession NM\_003683) is another VGAM1892 host target gene. D21S2056E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D21S2056E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D21S2056E BINDING SITE, designated SEQ ID:9789, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62602] Another function of VGAM1892 is therefore inhibition of D21S2056E (Accession NM\_003683). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D21S2056E. FLJ12154 (Accession NM\_021944) is another VGAM1892 host target gene. FLJ12154 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12154, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12154 BINDING SITE, designated SEQ ID:22463, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62603] Another function of VGAM1892 is therefore inhibition of FLJ12154 (Accession NM\_021944). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12154. Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654) is another VGAM1892 host target gene. SDC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC3 BINDING SITE, designated SEQ ID:16089, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62604] Another function of VGAM1892 is therefore inhibition of Syndecan 3 (N-syndecan) (SDC3, Accession NM\_014654). Accordingly, utilities of VGAM1892 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with SDC3. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4C (SEMA4C, Accession NM\_017789) is another VGAM1892 host target gene. SEMA4C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA4C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4C BINDING SITE, designated SEQ ID:19420, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62605] Another function of VGAM1892 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4C (SEMA4C, Accession NM\_017789). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4C. LOC130074 (Accession XM\_072228) is another VGAM1892 host target gene. LOC130074 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:37469, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62606] Another function of VGAM1892 is therefore inhibition of LOC130074 (Accession XM\_072228). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC144681 (Accession XM\_096654) is another VGAM1892 host target gene. LOC144681 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144681 BINDING SITE, designated SEQ ID:40453, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62607] Another function of VGAM1892 is therefore inhibition of

LOC144681 (Accession XM\_096654). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144681. LOC148438 (Accession XM\_097466) is another VGAM1892 host target gene. LOC148438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148438 BINDING SITE, designated SEQ ID:40883, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62608] Another function of VGAM1892 is therefore inhibition of LOC148438 (Accession XM\_097466). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148438. LOC203276 (Accession XM\_117523) is another VGAM1892 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43490, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62609] Another function of VGAM1892 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM1892 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43514, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62610] Another function of VGAM1892 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC254243 (Accession XM\_173233) is an-

other VGAM1892 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46516, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62611] Another function of VGAM1892 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC254887 (Accession XM\_172326) is another VGAM1892 host target gene. LOC254887 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254887, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254887 BINDING SITE, designated SEQ ID:46071, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62612] Another function of VGAM1892 is therefore inhibition of LOC254887 (Accession XM\_172326). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254887. LOC90038 (Accession XM\_028305) is another VGAM1892 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30653, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62613] Another function of VGAM1892 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. LOC92078 (Accession XM\_042684) is another VGAM1892 host target gene. LOC92078 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92078, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92078 BINDING SITE, designated SEQ ID:33741, to the nucleotide sequence of VGAM1892 RNA, herein designated VGAM RNA, also designated SEQ ID:4603.

[62614] Another function of VGAM1892 is therefore inhibition of LOC92078 (Accession XM\_042684). Accordingly, utilities of VGAM1892 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92078. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1893 (VGAM1893) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62615] VGAM1893 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1893 was detected is described hereinabove with reference to Figs. 1-8.

[62616] VGAM1893 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Newcastle Disease Virus. VGAM1893 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[62617] VGAM1893 gene encodes a VGAM1893 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1893 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1893 precursor RNA is designated SEQ ID:1879, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1879 is located at position 2483 relative to the genome of Newcastle Disease Virus.

[62618] VGAM1893 precursor RNA folds onto itself, forming VGAM1893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62619] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1893 folded precursor RNA into VGAM1893

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1893 RNA is designated SEQ ID:4604, and is provided hereinbelow with reference to the sequence listing part.

[62620] VGAM1893 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1893 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62621] VGAM1893 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1893 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1893 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62622] The complementary binding of VGAM1893 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1893 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1893 host target RNA into VGAM1893 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[62623] It is appreciated that VGAM1893 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1893 host target genes. The mRNA of each one of this plurality of VGAM1893 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1893 RNA, herein designated VGAM RNA, and which when bound by VGAM1893 RNA causes inhibition of translation of respective one or more VGAM1893 host target proteins.

[62624] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1893 gene, herein designated VGAM GENE, on one or more VGAM1893 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62625] It is yet further appreciated that a function of VGAM1893 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of viral infection by Newcastle Disease Virus. Specific functions, and accordingly utilities, of VGAM1893 correlate with, and may be deduced from, the identity of the host target genes which VGAM1893 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62626] Nucleotide sequences of the VGAM1893 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1893 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1893 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1893 are further described hereinbelow with reference to Table 1.

[62627] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1893 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1893 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62628] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1893 gene, herein designated VGAM is inhibition of expression of VGAM1893 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1893 correlate with, and may be deduced from, the identity of the target genes which VGAM1893 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62629] S-adenosylmethionine Decarboxylase 1 (AMD1, Accession NM\_001634) is a VGAM1893 host target gene. AMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMD1 BINDING SITE, designated SEQ ID:7349, to the nucleotide sequence of VGAM1893 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4604.

[62630] A function of VGAM1893 is therefore inhibition of S-adenosylmethionine Decarboxylase 1 (AMD1, Accession NM\_001634), a gene which catalyzes the removal of the carboxylate group of S-adenosylmethionine in the polyamine biosynthesis pathway. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMD1. The function of AMD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1016. Collagen, Type IV, Alpha 6 (COL4A6, Accession NM\_033641) is another VGAM1893 host target gene. COL4A6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by COL4A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A6 BINDING SITE, designated SEQ ID:27359, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62631] Another function of VGAM1893 is therefore inhibition of

Collagen, Type IV, Alpha 6 (COL4A6, Accession NM\_033641). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A6. Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM\_035403) is another VGAM1893 host target gene. CORO2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CORO2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORO2B BINDING SITE, designated SEQ ID:32254, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62632] Another function of VGAM1893 is therefore inhibition of Coronin, Actin Binding Protein, 2B (CORO2B, Accession XM\_035403), a gene which may play a role in the reorganization of neuronal actin structure. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORO2B. The function of CORO2B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM923.FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM\_001447) is another VGAM1893 host target gene. FAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:7175, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62633] Another function of VGAM1893 is therefore inhibition of FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM\_001447), a gene which could function as a cell-adhesion protein. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2. The function of FAT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949.Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM\_002531) is another VGAM1893 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8366, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62634] Another function of VGAM1893 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM\_002531), a gene which is associated with g proteins that activate a phosphatidylinositol– calcium second messenger system. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Procollagen–proline, 2–oxoglutarate 4–dioxygenase (proline 4–hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM\_000918) is another VGAM1893 host target gene. P4HB BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by P4HB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P4HB BINDING SITE, designated SEQ ID:6630, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62635] Another function of VGAM1893 is therefore inhibition of Procollagen-proline, 2-oxoglutarate 4-dioxygenase (proline 4-hydroxylase), Beta Polypeptide (protein disulfide isomerase; thyroid hormone binding protein p55) (P4HB, Accession NM\_000918), a gene which catalyzes formation of 4-hydroxyproline in collagens. Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P4HB. The function of P4HB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM589. Pim-2 Oncogene (PIM2, Accession XM\_010208) is another VGAM1893 host target gene. PIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIM2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM2 BINDING SITE, designated SEQ ID:30134, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62636] Another function of VGAM1893 is therefore inhibition of Pim-2 Oncogene (PIM2, Accession XM\_010208). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM2. Short Stature Homeobox (SHOX, Accession NM\_000451) is another VGAM1893 host target gene. SHOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHOX BINDING SITE, designated SEQ ID:6059, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62637] Another function of VGAM1893 is therefore inhibition of Short Stature Homeobox (SHOX, Accession NM\_000451). Accordingly, utilities of VGAM1893 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with SHOX. Chromosome 20 Open Reading Frame 39 (C20orf39, Accession NM\_024893) is another VGAM1893 host target gene. C20orf39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf39 BINDING SITE, designated SEQ ID:24368, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62638] Another function of VGAM1893 is therefore inhibition of Chromosome 20 Open Reading Frame 39 (C20orf39, Accession NM\_024893). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf39. Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM\_016045) is another VGAM1893 host target gene. C20orf45 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of C20orf45 BINDING SITE, designated SEQ ID:18122, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62639] Another function of VGAM1893 is therefore inhibition of Chromosome 20 Open Reading Frame 45 (C20orf45, Accession NM\_016045). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf45. CLONE24945 (Accession NM\_015683) is another VGAM1893 host target gene. CLONE24945 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLONE24945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLONE24945 BINDING SITE, designated SEQ ID:17907, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62640] Another function of VGAM1893 is therefore inhibition of CLONE24945 (Accession NM\_015683). Accordingly, utilities of VGAM1893 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with CLONE24945. FLJ11320 (Accession NM\_018389) is another VGAM1893 host target gene. FLJ11320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:20429, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62641] Another function of VGAM1893 is therefore inhibition of FLJ11320 (Accession NM\_018389). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320. FLJ23112 (Accession NM\_024929) is another VGAM1893 host target gene. FLJ23112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23112 BINDING SITE, designated SEQ ID:24466, to the nucleotide

sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62642] Another function of VGAM1893 is therefore inhibition of FLJ23112 (Accession NM\_024929). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23112. G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM\_014030) is another VGAM1893 host target gene. GIT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT1 BINDING SITE, designated SEQ ID:15259, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62643] Another function of VGAM1893 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM\_014030). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT1. KIAA1203 (Accession XM\_049683) is another VGAM1893 host target

gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35473, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62644] Another function of VGAM1893 is therefore inhibition of KIAA1203 (Accession XM\_049683). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. KIAA1538 (Accession XM\_049474) is another VGAM1893 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35434, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62645] Another function of VGAM1893 is therefore inhibition of KIAA1538 (Accession XM\_049474). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1655 (Accession XM\_039442) is another VGAM1893 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33088, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62646] Another function of VGAM1893 is therefore inhibition of KIAA1655 (Accession XM\_039442). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. KIAA1937 (Accession XM\_057107) is another VGAM1893 host target gene. KIAA1937 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1937, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1937 BINDING SITE, designated SEQ ID:36483, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62647] Another function of VGAM1893 is therefore inhibition of KIAA1937 (Accession XM\_057107). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1937. NDRG Family Member 4 (NDRG4, Accession NM\_020465) is another VGAM1893 host target gene. NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NDRG4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG4 BINDING SITE1 and NDRG4 BINDING SITE2, designated SEQ ID:21698 and SEQ ID:23213 respectively, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62648] Another function of VGAM1893 is therefore inhibition of NDRG Family Member 4 (NDRG4, Accession NM\_020465).

Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG4. Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282) is another VGAM1893 host target gene. UHRF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UHRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UHRF1 BINDING SITE, designated SEQ ID:14954, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62649] Another function of VGAM1893 is therefore inhibition of Ubiquitin-like, Containing PHD and RING Finger Domains, 1 (UHRF1, Accession NM\_013282). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UHRF1. YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM\_014263) is another VGAM1893 host target gene. YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions

of mRNA encoded by YME1L1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YME1L1 BINDING SITE1 and YME1L1 BINDING SITE2, designated SEQ ID:15539 and SEQ ID:29295 respectively, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62650] Another function of VGAM1893 is therefore inhibition of YME1-like 1 (*S. cerevisiae*) (YME1L1, Accession NM\_014263). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YME1L1. LOC165405 (Accession XM\_092567) is another VGAM1893 host target gene. LOC165405 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165405 BINDING SITE, designated SEQ ID:40130, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62651] Another function of VGAM1893 is therefore inhibition of LOC165405 (Accession XM\_092567). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165405. LOC202908 (Accession XM\_114602) is another VGAM1893 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:42997, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62652] Another function of VGAM1893 is therefore inhibition of LOC202908 (Accession XM\_114602). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202908. LOC91149 (Accession XM\_036480) is another VGAM1893 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32457, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62653] Another function of VGAM1893 is therefore inhibition of LOC91149 (Accession XM\_036480). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91149. LOC93276 (Accession XM\_050200) is another VGAM1893 host target gene. LOC93276 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93276 BINDING SITE, designated SEQ ID:35590, to the nucleotide sequence of VGAM1893 RNA, herein designated VGAM RNA, also designated SEQ ID:4604.

[62654] Another function of VGAM1893 is therefore inhibition of LOC93276 (Accession XM\_050200). Accordingly, utilities of VGAM1893 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93276. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1894 (VGAM1894) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62655] VGAM1894 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1894 was detected is described hereinabove with reference to Figs. 1–8.

[62656] VGAM1894 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62657] VGAM1894 gene encodes a VGAM1894 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1894 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1894 precursor RNA is designated SEQ ID:1880, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1880 is located at position 6434 relative to the genome of Respiratory Syncytial Virus.

- [62658] VGAM1894 precursor RNA folds onto itself, forming VGAM1894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [62659] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1894 folded precursor RNA into VGAM1894 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1894 RNA is designated SEQ ID:4605, and is provided hereinbelow with reference to the sequence listing part.

[62660] VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1894 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62661] VGAM1894 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1894 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1894 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[62662] The complementary binding of VGAM1894 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1894 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1894 host target RNA into VGAM1894 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62663] It is appreciated that VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1894 host target genes. The mRNA of each one of this plurality of VGAM1894 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1894 RNA, herein designated VGAM RNA, and which when bound by VGAM1894 RNA causes

inhibition of translation of respective one or more VGAM1894 host target proteins.

[62664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1894 gene, herein designated VGAM GENE, on one or more VGAM1894 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62665] It is yet further appreciated that a function of VGAM1894 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1894 include diagnosis, prevention and

treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1894 correlate with, and may be deduced from, the identity of the host target genes which VGAM1894 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62666] Nucleotide sequences of the VGAM1894 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1894 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1894 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1894 are further described hereinbelow with reference to Table 1.

[62667] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1894 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1894 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62668] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1894 gene, herein designated VGAM is inhibition of expression of VGAM1894 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1894 correlate with, and may be deduced from, the identity of the target genes which VGAM1894 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62669] Lanosterol Synthase (2,3-oxidosqualene-lanosterol cyclase) (LSS, Accession NM\_002340) is a VGAM1894 host target gene. LSS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LSS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LSS BINDING SITE, designated SEQ ID:8140, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62670] A function of VGAM1894 is therefore inhibition of Lanosterol Synthase (2,3-oxidosqualene-lanosterol cyclase) (LSS, Accession NM\_002340). Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LSS. Chondrolectin (CHODL, Accession NM\_024944) is another VGAM1894 host target gene. CHODL BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CHODL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHODL BINDING SITE, designated SEQ ID:24492, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62671] Another function of VGAM1894 is therefore inhibition of Chondrolectin (CHODL, Accession NM\_024944). Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHODL. FLJ12057 (Accession NM\_024768) is another VGAM1894 host target gene. FLJ12057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12057 BINDING SITE, designated SEQ ID:24124, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62672] Another function of VGAM1894 is therefore inhibition of FLJ12057 (Accession NM\_024768). Accordingly, utilities of

VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12057. FLJ23360 (Accession NM\_023076) is another VGAM1894 host target gene. FLJ23360 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23360 BINDING SITE, designated SEQ ID:23337, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62673] Another function of VGAM1894 is therefore inhibition of FLJ23360 (Accession NM\_023076). Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23360. Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM\_145255) is another VGAM1894 host target gene. MRPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MRPL10 BINDING SITE, designated SEQ ID:29771, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62674] Another function of VGAM1894 is therefore inhibition of Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM\_145255). Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL10. LOC143680 (Accession XM\_096474) is another VGAM1894 host target gene. LOC143680 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143680, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143680 BINDING SITE, designated SEQ ID:40375, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62675] Another function of VGAM1894 is therefore inhibition of LOC143680 (Accession XM\_096474). Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143680. LOC256433 (Accession XM\_173657) is another VGAM1894 host target gene. LOC256433 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256433 BINDING SITE, designated SEQ ID:46553, to the nucleotide sequence of VGAM1894 RNA, herein designated VGAM RNA, also designated SEQ ID:4605.

[62676] Another function of VGAM1894 is therefore inhibition of LOC256433 (Accession XM\_173657). Accordingly, utilities of VGAM1894 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256433. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1895 (VGAM1895) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62677] VGAM1895 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1895 was detected is described hereinabove with reference to Figs. 1–8.

[62678] VGAM1895 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus.

VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62679] VGAM1895 gene encodes a VGAM1895 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1895 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1895 precursor RNA is designated SEQ ID:1881, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1881 is located at position 2156 relative to the genome of Garlic Latent Virus.

[62680] VGAM1895 precursor RNA folds onto itself, forming VGAM1895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62681] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1895 folded precursor RNA into VGAM1895 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1895 RNA is designated SEQ ID:4606, and is provided hereinbelow with reference to the sequence listing part.

[62682] VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1895 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62683] VGAM1895 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1895 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1895 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[62684] The complementary binding of VGAM1895 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1895 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1895 host target RNA into VGAM1895 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62685] It is appreciated that VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1895 host target genes. The mRNA of each one of this plurality of VGAM1895 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1895 RNA, herein designated VGAM RNA, and which when bound by VGAM1895 RNA causes inhibition of translation of respective one or more VGAM1895 host target proteins.

[62686] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1895 gene, herein designated VGAM GENE, on one or more VGAM1895 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62687] It is yet further appreciated that a function of VGAM1895 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1895 correlate with, and may be deduced from, the identity of the host target genes which VGAM1895 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62688] Nucleotide sequences of the VGAM1895 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1895 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1895 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1895 are further described hereinbelow with reference to Table 1.

[62689] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1895 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1895 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62690] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1895 gene, herein designated VGAM is inhibition of expression of VGAM1895 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1895 correlate with, and may be deduced from, the identity of the target genes which VGAM1895 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62691] DKFZP434E2135 (Accession NM\_030804) is a VGAM1895 host target gene. DKFZP434E2135 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434E2135, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25118, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62692] A function of VGAM1895 is therefore inhibition of DKFZP434E2135 (Accession NM\_030804). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. KIAA0563 (Accession NM\_014834) is another VGAM1895 host target gene. KIAA0563 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0563 BINDING SITE, designated SEQ ID:16846, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62693] Another function of VGAM1895 is therefore inhibition of KIAA0563 (Accession NM\_014834). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0563. KIAA1503 (Accession XM\_043197) is another VGAM1895 host target gene. KIAA1503 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1503, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1503 BINDING SITE, designated SEQ ID:33918, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62694] Another function of VGAM1895 is therefore inhibition of KIAA1503 (Accession XM\_043197). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1503. KIAA1958 (Accession XM\_088566) is another VGAM1895 host target gene. KIAA1958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1958 BINDING SITE, designated SEQ ID:39832, to the

nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62695] Another function of VGAM1895 is therefore inhibition of KIAA1958 (Accession XM\_088566). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1958. LOC112609 (Accession XM\_053013) is another VGAM1895 host target gene. LOC112609 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112609 BINDING SITE, designated SEQ ID:36057, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62696] Another function of VGAM1895 is therefore inhibition of LOC112609 (Accession XM\_053013). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112609. LOC147071 (Accession XM\_054031) is another VGAM1895 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36140, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62697] Another function of VGAM1895 is therefore inhibition of LOC147071 (Accession XM\_054031). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC149271 (Accession XM\_086475) is another VGAM1895 host target gene. LOC149271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149271 BINDING SITE, designated SEQ ID:38677, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62698] Another function of VGAM1895 is therefore inhibition of LOC149271 (Accession XM\_086475). Accordingly, utilities

of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149271. LOC221092 (Accession XM\_167749) is another VGAM1895 host target gene. LOC221092 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221092 BINDING SITE, designated SEQ ID:44775, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62699] Another function of VGAM1895 is therefore inhibition of LOC221092 (Accession XM\_167749). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221092. LOC255328 (Accession XM\_172920) is another VGAM1895 host target gene. LOC255328 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC255328 BINDING SITE, designated SEQ ID:46180, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62700] Another function of VGAM1895 is therefore inhibition of LOC255328 (Accession XM\_172920). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328. LOC92719 (Accession XM\_046853) is another VGAM1895 host target gene. LOC92719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92719 BINDING SITE, designated SEQ ID:34849, to the nucleotide sequence of VGAM1895 RNA, herein designated VGAM RNA, also designated SEQ ID:4606.

[62701] Another function of VGAM1895 is therefore inhibition of LOC92719 (Accession XM\_046853). Accordingly, utilities of VGAM1895 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1896 (VGAM1896) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62702] VGAM1896 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1896 was detected is described hereinabove with reference to Figs. 1–8.

[62703] VGAM1896 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62704] VGAM1896 gene encodes a VGAM1896 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1896 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1896 precursor RNA is designated SEQ ID:1882, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1882 is located at position 4399 relative to the

genome of Respiratory Syncytial Virus.

[62705] VGAM1896 precursor RNA folds onto itself, forming VGAM1896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62706] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1896 folded precursor RNA into VGAM1896 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1896 RNA is designated SEQ ID:4607, and is provided hereinbelow with reference to the sequence listing part.

[62707] VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1896 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[62708] VGAM1896 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1896 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1896 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62709] The complementary binding of VGAM1896 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1896 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1896 host target RNA into VGAM1896 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62710] It is appreciated that VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1896 host target genes. The mRNA of each one of this plurality of VGAM1896 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1896 RNA, herein designated VGAM RNA, and which when bound by VGAM1896 RNA causes inhibition of translation of respective one or more VGAM1896 host target proteins.

[62711] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1896 gene, herein designated VGAM GENE, on one or more VGAM1896 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62712] It is yet further appreciated that a function of VGAM1896 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1896

correlate with, and may be deduced from, the identity of the host target genes which VGAM1896 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62713] Nucleotide sequences of the VGAM1896 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1896 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1896 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1896 are further described hereinbelow with reference to Table 1.

[62714] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1896 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1896 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62715] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1896 gene, herein designated VGAM is inhibition of expression of VGAM1896 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1896 correlate with, and may be deduced

from, the identity of the target genes which VGAM1896 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62716] Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709) is a VGAM1896 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8558, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62717] A function of VGAM1896 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM\_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1CB. The function of PPP1CB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM46.BY55 (Accession XM\_001667) is another VGAM1896 host target gene. BY55 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BY55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BY55 BINDING SITE, designated SEQ ID:29845, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62718] Another function of VGAM1896 is therefore inhibition of BY55 (Accession XM\_001667). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BY55. KIAA1042 (Accession NM\_014965) is another VGAM1896 host target gene. KIAA1042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1042 BINDING SITE, designated SEQ ID:17353, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4607.

[62719] Another function of VGAM1896 is therefore inhibition of KIAA1042 (Accession NM\_014965). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1042. MAWBP (Accession NM\_022129) is another VGAM1896 host target gene. MAWBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAWBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAWBP BINDING SITE, designated SEQ ID:22681, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62720] Another function of VGAM1896 is therefore inhibition of MAWBP (Accession NM\_022129). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAWBP. MEGF10 (Accession NM\_032446) is another VGAM1896 host target gene. MEGF10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEGF10, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEGF10 BINDING SITE, designated SEQ ID:26209, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62721] Another function of VGAM1896 is therefore inhibition of MEGF10 (Accession NM\_032446). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEGF10. LOC151361 (Accession XM\_098048) is another VGAM1896 host target gene. LOC151361 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151361 BINDING SITE, designated SEQ ID:41333, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62722] Another function of VGAM1896 is therefore inhibition of LOC151361 (Accession XM\_098048). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC151361. LOC162333 (Accession XM\_102591) is another VGAM1896 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42130, to the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62723] Another function of VGAM1896 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC201725 (Accession XM\_114370) is another VGAM1896 host target gene. LOC201725 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201725 BINDING SITE, designated SEQ ID:42905, to

the nucleotide sequence of VGAM1896 RNA, herein designated VGAM RNA, also designated SEQ ID:4607.

[62724] Another function of VGAM1896 is therefore inhibition of LOC201725 (Accession XM\_114370). Accordingly, utilities of VGAM1896 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201725. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1897 (VGAM1897) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62725] VGAM1897 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1897 was detected is described hereinabove with reference to Figs. 1–8.

[62726] VGAM1897 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus. VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62727] VGAM1897 gene encodes a VGAM1897 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1897 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1897 precursor RNA is designated SEQ ID:1883, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1883 is located at position 5382 relative to the genome of Garlic Latent Virus.

[62728] VGAM1897 precursor RNA folds onto itself, forming VGAM1897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62729] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1897 folded precursor RNA into VGAM1897 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1897 RNA is designated SEQ ID:4608, and is provided hereinbelow with reference to the sequence listing part.

[62730] VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1897 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62731] VGAM1897 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1897 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1897 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62732] The complementary binding of VGAM1897 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1897 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1897 host target RNA into VGAM1897 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62733] It is appreciated that VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1897 host target genes. The mRNA of each one of this plurality of VGAM1897 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1897 RNA, herein designated VGAM RNA, and which when bound by VGAM1897 RNA causes inhibition of translation of respective one or more VGAM1897 host target proteins.

[62734] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1897 gene, herein designated VGAM GENE, on one or more VGAM1897 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[62735] It is yet further appreciated that a function of VGAM1897 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1897 correlate with, and may be deduced from, the identity of the host target genes which VGAM1897 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62736] Nucleotide sequences of the VGAM1897 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1897 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1897 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1897 are further described hereinbelow with reference to Table 1.

[62737] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1897 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1897 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62738] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1897 gene, herein designated VGAM is inhibition of expression of VGAM1897 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1897 correlate with, and may be deduced from, the identity of the target genes which VGAM1897 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62739] Microfibrillar-associated Protein 3 (MFAP3, Accession NM\_005927) is a VGAM1897 host target gene. MFAP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MFAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MFAP3 BINDING SITE, designated SEQ ID:12555, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62740] A function of VGAM1897 is therefore inhibition of Microfibrillar-associated Protein 3 (MFAP3, Accession

NM\_005927). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFAP3. Pro-melanin-concentrating Hormone-like 1 (PMCHL1, Accession NM\_031887) is another VGAM1897 host target gene. PMCHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMCHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMCHL1 BINDING SITE, designated SEQ ID:25631, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62741] Another function of VGAM1897 is therefore inhibition of Pro-melanin-concentrating Hormone-like 1 (PMCHL1, Accession NM\_031887). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMCHL1. Calcium Binding Atopy-related Autoantigen 1 (CBARA1, Accession NM\_006077) is another VGAM1897 host target gene. CBARA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CBARA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBARA1 BINDING SITE, designated SEQ ID:12723, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62742] Another function of VGAM1897 is therefore inhibition of Calcium Binding Atopy-related Autoantigen 1 (CBARA1, Accession NM\_006077). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBARA1. FLJ10704 (Accession NM\_018185) is another VGAM1897 host target gene. FLJ10704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:20033, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62743] Another function of VGAM1897 is therefore inhibition of

FLJ10704 (Accession NM\_018185). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. FLJ13456 (Accession XM\_038291) is another VGAM1897 host target gene. FLJ13456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13456 BINDING SITE, designated SEQ ID:32798, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62744] Another function of VGAM1897 is therefore inhibition of FLJ13456 (Accession XM\_038291). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13456. KIAA1013 (Accession XM\_114303) is another VGAM1897 host target gene. KIAA1013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1013 BINDING SITE, designated SEQ ID:42857, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62745] Another function of VGAM1897 is therefore inhibition of KIAA1013 (Accession XM\_114303). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1013. MGC32104 (Accession NM\_144684) is another VGAM1897 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC32104, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:29505, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62746] Another function of VGAM1897 is therefore inhibition of MGC32104 (Accession NM\_144684). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. Serine Palmitoyltransferase, Long Chain Base

Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM1897 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11277, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62747] Another function of VGAM1897 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517) is another VGAM1897 host target gene. UBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBP1 BINDING SITE, designated SEQ ID:15846,

to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62748] Another function of VGAM1897 is therefore inhibition of Upstream Binding Protein 1 (LBP-1a) (UBP1, Accession NM\_014517). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBP1. LOC144348 (Accession XM\_084826) is another VGAM1897 host target gene. LOC144348 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144348, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144348 BINDING SITE, designated SEQ ID:37721, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62749] Another function of VGAM1897 is therefore inhibition of LOC144348 (Accession XM\_084826). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144348. LOC196418 (Accession XM\_113717) is another VGAM1897 host target gene. LOC196418 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196418 BINDING SITE, designated SEQ ID:42369, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62750] Another function of VGAM1897 is therefore inhibition of LOC196418 (Accession XM\_113717). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196418. LOC221362 (Accession XM\_168093) is another VGAM1897 host target gene. LOC221362 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221362 BINDING SITE, designated SEQ ID:45020, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62751] Another function of VGAM1897 is therefore inhibition of

LOC221362 (Accession XM\_168093). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221362. LOC254672 (Accession XM\_170619) is another VGAM1897 host target gene. LOC254672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254672 BINDING SITE, designated SEQ ID:45398, to the nucleotide sequence of VGAM1897 RNA, herein designated VGAM RNA, also designated SEQ ID:4608.

[62752] Another function of VGAM1897 is therefore inhibition of LOC254672 (Accession XM\_170619). Accordingly, utilities of VGAM1897 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254672. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1898 (VGAM1898) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[62753] VGAM1898 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1898 was detected is described hereinabove with reference to Figs. 1–8.

[62754] VGAM1898 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Garlic Latent Virus. VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62755] VGAM1898 gene encodes a VGAM1898 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1898 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1898 precursor RNA is designated SEQ ID:1884, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1884 is located at position 4971 relative to the genome of Garlic Latent Virus.

[62756] VGAM1898 precursor RNA folds onto itself, forming VGAM1898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62757] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1898 folded precursor RNA into VGAM1898 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1898 RNA is designated SEQ ID:4609, and is provided hereinbelow with reference to the sequence listing part.

[62758] VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1898 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[62759] VGAM1898 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1898 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1898 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[62760] The complementary binding of VGAM1898 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1898 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1898 host target RNA into VGAM1898 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62761] It is appreciated that VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1898 host target genes. The mRNA of each one of this plurality of VGAM1898 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1898 RNA, herein designated VGAM RNA, and which when bound by VGAM1898 RNA causes inhibition of translation of respective one or more VGAM1898 host target proteins.

[62762] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1898 gene, herein designated VGAM GENE, on one

or more VGAM1898 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62763] It is yet further appreciated that a function of VGAM1898 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1898 include diagnosis, prevention and treatment of viral infection by Garlic Latent Virus. Specific functions, and accordingly utilities, of VGAM1898 correlate with, and may be deduced from, the identity of the host target genes which VGAM1898 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62764] Nucleotide sequences of the VGAM1898 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1898 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1898 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1898 are further described hereinbelow with reference to Table 1.

[62765] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1898 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1898 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62766] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1898 gene, herein designated VGAM is inhibition of expression of VGAM1898 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1898 correlate with, and may be deduced from, the identity of the target genes which VGAM1898 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62767] Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Acces-

sion NM\_053023) is a VGAM1898 host target gene. ZFP91 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP91, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP91 BINDING SITE, designated SEQ ID:27571, to the nucleotide sequence of VGAM1898 RNA, herein designated VGAM RNA, also designated SEQ ID:4609.

[62768] A function of VGAM1898 is therefore inhibition of Zinc Finger Protein 91 Homolog (mouse) (ZFP91, Accession NM\_053023). Accordingly, utilities of VGAM1898 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP91. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1899 (VGAM1899) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62769] VGAM1899 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1899 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[62770] VGAM1899 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62771] VGAM1899 gene encodes a VGAM1899 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1899 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1899 precursor RNA is designated SEQ ID:1885, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1885 is located at position 7191 relative to the genome of Respiratory Syncytial Virus.

[62772] VGAM1899 precursor RNA folds onto itself, forming VGAM1899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62773] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1899 folded precursor RNA into VGAM1899 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1899 RNA is designated SEQ ID:4610, and is provided hereinbelow with reference to the sequence listing part.

[62774] VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1899 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62775] VGAM1899 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1899 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1899 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1899 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62776] The complementary binding of VGAM1899 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1899 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1899 host target RNA into VGAM1899 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62777] It is appreciated that VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1899 host target genes. The mRNA of each one of this plurality of VGAM1899 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1899 RNA, herein designated VGAM RNA, and which when bound by VGAM1899 RNA causes inhibition of translation of respective one or more VGAM1899 host target proteins.

[62778] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1899 gene, herein designated VGAM GENE, on one or more VGAM1899 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62779] It is yet further appreciated that a function of VGAM1899 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1899 correlate with, and may be deduced from, the identity of the host target genes which VGAM1899 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62780] Nucleotide sequences of the VGAM1899 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1899 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1899 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1899 are further described hereinbelow with reference to Table 1.

[62781] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1899 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1899 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62782] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1899 gene, herein designated VGAM is inhibition of expression of VGAM1899 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1899 correlate with, and may be deduced from, the identity of the target genes which VGAM1899 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62783] Fibrillin 1 (Marfan syndrome) (FBN1, Accession XM\_034890) is a VGAM1899 host target gene. FBN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBN1, corresponding to a HOST TARGET binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBN1 BINDING SITE, designated SEQ ID:32183, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62784] A function of VGAM1899 is therefore inhibition of Fibrillin 1 (Marfan syndrome) (FBN1, Accession XM\_034890). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBN1. GNAS Complex Locus (GNAS, Accession NM\_016592) is another VGAM1899 host target gene. GNAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAS BINDING SITE, designated SEQ ID:18678, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62785] Another function of VGAM1899 is therefore inhibition of GNAS Complex Locus (GNAS, Accession NM\_016592), a gene which transduces signals from G protein-coupled receptors and activates adenylyl cyclase. Accordingly, util-

ities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAS. The function of GNAS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205. Tropomodulin (TMOD, Accession NM\_003275) is another VGAM1899 host target gene. TMOD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD BINDING SITE, designated SEQ ID:9295, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62786] Another function of VGAM1899 is therefore inhibition of Tropomodulin (TMOD, Accession NM\_003275), a gene which blocks the elongation and depolymerization of the actin filaments at the pointed end. Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD. The function of TMOD and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM716.ATP-binding Cassette, Sub-family A (ABC1), Member 8 (ABCA8, Accession NM\_007168) is another VGAM1899 host target gene. ABCA8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA8 BINDING SITE, designated SEQ ID:14013, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62787] Another function of VGAM1899 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 8 (ABCA8, Accession NM\_007168). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA8. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536) is another VGAM1899 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10884, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62788] Another function of VGAM1899 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. FLJ10508 (Accession NM\_018118) is another VGAM1899 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated SEQ ID:19893, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62789] Another function of VGAM1899 is therefore inhibition of FLJ10508 (Accession NM\_018118). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10508. FLJ12747 (Accession NM\_032173) is another VGAM1899 host target gene. FLJ12747 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12747 BINDING SITE, designated SEQ ID:25878, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62790] Another function of VGAM1899 is therefore inhibition of FLJ12747 (Accession NM\_032173). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12747. KIAA0527 (Accession XM\_171054) is another VGAM1899 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45850, to the nucleotide sequence of VGAM1899 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4610.

[62791] Another function of VGAM1899 is therefore inhibition of KIAA0527 (Accession XM\_171054). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA1948 (Accession XM\_091984) is another VGAM1899 host target gene. KIAA1948 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1948, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1948 BINDING SITE, designated SEQ ID:40077, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62792] Another function of VGAM1899 is therefore inhibition of KIAA1948 (Accession XM\_091984). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1948. NESHBP (Accession NM\_015429) is another VGAM1899 host target gene. NESHBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NESHBP, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NESHBP BINDING SITE, designated SEQ ID:17728, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62793] Another function of VGAM1899 is therefore inhibition of NESHBP (Accession NM\_015429). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NESHBP. P311 (Accession NM\_004772) is another VGAM1899 host target gene. P311 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P311 BINDING SITE, designated SEQ ID:11161, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62794] Another function of VGAM1899 is therefore inhibition of P311 (Accession NM\_004772). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with P311. Pleckstrin Homology Domain Interacting Protein (PHIP, Accession NM\_017934) is another VGAM1899 host target gene. PHIP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHIP BINDING SITE, designated SEQ ID:19622, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62795] Another function of VGAM1899 is therefore inhibition of Pleckstrin Homology Domain Interacting Protein (PHIP, Accession NM\_017934). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHIP. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM1899 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SPTLC2 BINDING SITE, designated SEQ ID:11273, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62796] Another function of VGAM1899 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. LOC144747 (Accession XM\_084954) is another VGAM1899 host target gene. LOC144747 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144747 BINDING SITE, designated SEQ ID:37783, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62797] Another function of VGAM1899 is therefore inhibition of LOC144747 (Accession XM\_084954). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144747. LOC149372 (Accession XM\_086509) is another VGAM1899 host target gene. LOC149372 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149372 BINDING SITE, designated SEQ ID:38723, to the nucleotide sequence of VGAM1899 RNA, herein designated VGAM RNA, also designated SEQ ID:4610.

[62798] Another function of VGAM1899 is therefore inhibition of LOC149372 (Accession XM\_086509). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149372. LOC257463 (Accession XM\_048605) is another VGAM1899 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257463 BINDING SITE, designated SEQ ID:35206, to the nucleotide sequence of VGAM1899 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4610.

[62799] Another function of VGAM1899 is therefore inhibition of LOC257463 (Accession XM\_048605). Accordingly, utilities of VGAM1899 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1900 (VGAM1900) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62800] VGAM1900 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1900 was detected is described hereinabove with reference to Figs. 1–8.

[62801] VGAM1900 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62802] VGAM1900 gene encodes a VGAM1900 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1900 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1900 precursor RNA is designated SEQ ID:1886, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1886 is located at position 438 relative to the genome of Respiratory Syncytial Virus.

[62803] VGAM1900 precursor RNA folds onto itself, forming VGAM1900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62804] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1900 folded precursor RNA into VGAM1900 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1900 RNA is designated SEQ ID:4611, and is provided hereinbelow with reference to the sequence listing part.

[62805] VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1900 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62806] VGAM1900 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1900 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1900 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62807] The complementary binding of VGAM1900 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1900 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1900 host target RNA into VGAM1900 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62808] It is appreciated that VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1900 host target genes. The mRNA of

each one of this plurality of VGAM1900 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1900 RNA, herein designated VGAM RNA, and which when bound by VGAM1900 RNA causes inhibition of translation of respective one or more VGAM1900 host target proteins.

[62809] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1900 gene, herein designated VGAM GENE, on one or more VGAM1900 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[62810] It is yet further appreciated that a function of VGAM1900 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1900 correlate with, and may be deduced from, the identity of the host target genes which VGAM1900 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62811] Nucleotide sequences of the VGAM1900 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1900 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1900 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1900 are further described hereinbelow with reference to Table 1.

[62812] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1900 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1900 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62813] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1900 gene, herein designated VGAM is inhibition of expression of VGAM1900 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1900 correlate with, and may be deduced from, the identity of the target genes which VGAM1900 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62814] Adenylate Cyclase 2 (brain) (ADCY2, Accession XM\_036383) is a VGAM1900 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:32435, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62815] A function of VGAM1900 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM\_036383), a gene which Adenylate cyclase (type 2), an ATP-

pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is another VGAM1900 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41886, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62816] Another function of VGAM1900 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Interferon, Gamma-inducible Protein 16 (IFI16, Accession XM\_048826) is an-

other VGAM1900 host target gene. IFI16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IFI16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IFI16 BINDING SITE, designated SEQ ID:35282, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62817] Another function of VGAM1900 is therefore inhibition of Interferon, Gamma-inducible Protein 16 (IFI16, Accession XM\_048826), a gene which could have a role in the regulation of hematopoietic differentiation and controls cellular proliferation. Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IFI16. The function of IFI16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1182. Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM\_030809) is another VGAM1900 host target gene. C12orf22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by C12orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf22 BINDING SITE, designated SEQ ID:25124, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62818] Another function of VGAM1900 is therefore inhibition of Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM\_030809). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf22. Calcyphosphine 2 (CAPS2, Accession XM\_047354) is another VGAM1900 host target gene. CAPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPS2 BINDING SITE, designated SEQ ID:34953, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62819] Another function of VGAM1900 is therefore inhibition of

Calcyphosphine 2 (CAPS2, Accession XM\_047354). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPS2. CTP Synthase II (CTPS2, Accession NM\_019857) is another VGAM1900 host target gene. CTPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTPS2 BINDING SITE, designated SEQ ID:21264, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62820] Another function of VGAM1900 is therefore inhibition of CTP Synthase II (CTPS2, Accession NM\_019857). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTPS2. FLJ10300 (Accession NM\_018051) is another VGAM1900 host target gene. FLJ10300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10300, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10300 BINDING SITE, designated SEQ ID:19811, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62821] Another function of VGAM1900 is therefore inhibition of FLJ10300 (Accession NM\_018051). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10300. SCYA28 (Accession NM\_019846) is another VGAM1900 host target gene. SCYA28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYA28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA28 BINDING SITE, designated SEQ ID:21251, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62822] Another function of VGAM1900 is therefore inhibition of SCYA28 (Accession NM\_019846). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

SCYA28. STHM (Accession NM\_006456) is another VGAM1900 host target gene. STHM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STHM BINDING SITE, designated SEQ ID:13177, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62823] Another function of VGAM1900 is therefore inhibition of STHM (Accession NM\_006456). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STHM. LOC151429 (Accession XM\_098059) is another VGAM1900 host target gene. LOC151429 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151429 BINDING SITE, designated SEQ ID:41344, to the nucleotide sequence of VGAM1900 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4611.

[62824] Another function of VGAM1900 is therefore inhibition of LOC151429 (Accession XM\_098059). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151429. LOC153454 (Accession XM\_087672) is another VGAM1900 host target gene. LOC153454 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153454, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153454 BINDING SITE, designated SEQ ID:39376, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62825] Another function of VGAM1900 is therefore inhibition of LOC153454 (Accession XM\_087672). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153454. LOC203504 (Accession XM\_117550) is another VGAM1900 host target gene. LOC203504 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203504, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203504 BINDING SITE, designated SEQ ID:43573, to the nucleotide sequence of VGAM1900 RNA, herein designated VGAM RNA, also designated SEQ ID:4611.

[62826] Another function of VGAM1900 is therefore inhibition of LOC203504 (Accession XM\_117550). Accordingly, utilities of VGAM1900 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203504. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1901 (VGAM1901) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62827] VGAM1901 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1901 was detected is described hereinabove with reference to Figs. 1-8.

[62828] VGAM1901 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial

Virus. VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62829] VGAM1901 gene encodes a VGAM1901 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1901 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1901 precursor RNA is designated SEQ ID:1887, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1887 is located at position 2370 relative to the genome of Respiratory Syncytial Virus.

[62830] VGAM1901 precursor RNA folds onto itself, forming VGAM1901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62831] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1901 folded precursor RNA into VGAM1901 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM1901 RNA is designated SEQ ID:4612, and is provided hereinbelow with reference to the sequence listing part.

[62832] VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1901 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62833] VGAM1901 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1901 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1901 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62834] The complementary binding of VGAM1901 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1901 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1901 host target RNA into VGAM1901 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62835] It is appreciated that VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1901 host target genes. The mRNA of each one of this plurality of VGAM1901 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1901 RNA, herein designated VGAM RNA, and which when bound by VGAM1901 RNA causes inhibition of translation of respective one or more VGAM1901 host target proteins.

[62836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1901 gene, herein designated VGAM GENE, on one or more VGAM1901 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62837] It is yet further appreciated that a function of VGAM1901 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1901 correlate with, and may be deduced from, the identity of the host target genes which VGAM1901 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62838] Nucleotide sequences of the VGAM1901 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1901 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1901 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1901 are further described hereinbelow with reference to Table 1.

[62839] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1901 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1901 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62840] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1901 gene, herein designated VGAM is inhibition of expression of VGAM1901 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1901 correlate with, and may be deduced from, the identity of the target genes which VGAM1901 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62841] C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252) is a VGAM1901 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CLECSF5 BINDING SITE, designated SEQ ID:14915, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62842] A function of VGAM1901 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053) is another VGAM1901 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32993, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62843] Another function of VGAM1901 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053), a gene which Estrogen-related receptor

gamma. Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRG. The function of ESRRG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM359.F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM\_033644) is another VGAM1901 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:27362, SEQ ID:27372 and SEQ ID:14660 respectively, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62844] Another function of VGAM1901 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM\_033644), a gene which somehow is involved in the process of neuronal cell differentiation or brain develop-

ment. Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.SMA3 (Accession NM\_006780) is another VGAM1901 host target gene. SMA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMA3 BINDING SITE, designated SEQ ID:13653, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62845] Another function of VGAM1901 is therefore inhibition of SMA3 (Accession NM\_006780). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMA3. LOC151056 (Accession XM\_087088) is another VGAM1901 host target gene. LOC151056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151056, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151056 BINDING SITE, designated SEQ ID:39046, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62846] Another function of VGAM1901 is therefore inhibition of LOC151056 (Accession XM\_087088). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151056. LOC157247 (Accession XM\_088275) is another VGAM1901 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39572, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62847] Another function of VGAM1901 is therefore inhibition of LOC157247 (Accession XM\_088275). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157247. LOC222066 (Accession XM\_166582) is another VGAM1901 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:44553, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62848] Another function of VGAM1901 is therefore inhibition of LOC222066 (Accession XM\_166582). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. LOC254504 (Accession XM\_173192) is another VGAM1901 host target gene. LOC254504 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254504 BINDING SITE, designated SEQ ID:46437, to

the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62849] Another function of VGAM1901 is therefore inhibition of LOC254504 (Accession XM\_173192). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254504. LOC90520 (Accession XM\_032277) is another VGAM1901 host target gene. LOC90520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90520 BINDING SITE, designated SEQ ID:31629, to the nucleotide sequence of VGAM1901 RNA, herein designated VGAM RNA, also designated SEQ ID:4612.

[62850] Another function of VGAM1901 is therefore inhibition of LOC90520 (Accession XM\_032277). Accordingly, utilities of VGAM1901 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90520. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1902 (VGAM1902) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62851] VGAM1902 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1902 was detected is described hereinabove with reference to Figs. 1–8.

[62852] VGAM1902 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62853] VGAM1902 gene encodes a VGAM1902 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1902 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1902 precursor RNA is designated SEQ ID:1888, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1888 is located at position 8673 relative to the genome of Respiratory Syncytial Virus.

[62854] VGAM1902 precursor RNA folds onto itself, forming VGAM1902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62855] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1902 folded precursor RNA into VGAM1902 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1902 RNA is designated SEQ ID:4613, and is provided hereinbelow with reference to the sequence listing part.

[62856] VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1902 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1902 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[62857] VGAM1902 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1902 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1902 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62858] The complementary binding of VGAM1902 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1902 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1902 host target RNA into VGAM1902 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62859] It is appreciated that VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1902 host target genes. The mRNA of each one of this plurality of VGAM1902 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1902 RNA, herein designated VGAM RNA, and which when bound by VGAM1902 RNA causes inhibition of translation of respective one or more VGAM1902 host target proteins.

[62860] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1902 gene, herein designated VGAM GENE, on one or more VGAM1902 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62861] It is yet further appreciated that a function of VGAM1902 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1902 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1902 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1902 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62862] Nucleotide sequences of the VGAM1902 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1902 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1902 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1902 are further described hereinbelow with reference to Table 1.

[62863] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1902 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1902 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62864] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1902 gene, herein designated VGAM is inhibition of expression of VGAM1902 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1902 correlate with, and may be deduced from, the identity of the target genes which VGAM1902

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62865] PRO2015 (Accession NM\_018512) is a VGAM1902 host target gene. PRO2015 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2015 BINDING SITE, designated SEQ ID:20585, to the nucleotide sequence of VGAM1902 RNA, herein designated VGAM RNA, also designated SEQ ID:4613.

[62866] A function of VGAM1902 is therefore inhibition of PRO2015 (Accession NM\_018512). Accordingly, utilities of VGAM1902 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2015. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1903 (VGAM1903) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62867] VGAM1903 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1903 was detected is described hereinabove with reference to Figs. 1–8.

[62868] VGAM1903 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62869] VGAM1903 gene encodes a VGAM1903 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1903 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1903 precursor RNA is designated SEQ ID:1889, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1889 is located at position 14231 relative to the genome of Respiratory Syncytial Virus.

[62870] VGAM1903 precursor RNA folds onto itself, forming VGAM1903 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62871] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1903 folded precursor RNA into VGAM1903 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1903 RNA is designated SEQ ID:4614, and is provided hereinbelow with reference to the sequence listing part.

[62872] VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1903 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[62873] VGAM1903 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1903 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1903 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62874] The complementary binding of VGAM1903 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1903 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1903 host target RNA into VGAM1903 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62875] It is appreciated that VGAM1903 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1903 host target genes. The mRNA of each one of this plurality of VGAM1903 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1903 RNA, herein designated VGAM RNA, and which when bound by VGAM1903 RNA causes inhibition of translation of respective one or more VGAM1903 host target proteins.

[62876] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1903 gene, herein designated VGAM GENE, on one or more VGAM1903 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62877] It is yet further appreciated that a function of VGAM1903 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1903 correlate with, and may be deduced from, the identity of the host target genes which VGAM1903 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62878] Nucleotide sequences of the VGAM1903 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1903 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1903 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1903 are further  
described hereinbelow with reference to Table 1.

[62879] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1903 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1903 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[62880] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1903 gene, herein designated VGAM is  
inhibition of expression of VGAM1903 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1903 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1903  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[62881] Mucin 3B (MUC3B, Accession XM\_168578) is a VGAM1903  
host target gene. MUC3B BINDING SITE is HOST TARGET

binding site found in the 5' untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:45254, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62882] A function of VGAM1903 is therefore inhibition of Mucin 3B (MUC3B, Accession XM\_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Reelin (RELN, Accession XM\_168628) is another VGAM1903 host target gene. RELN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RELN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of RELN BINDING SITE, designated SEQ ID:45282, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62883] Another function of VGAM1903 is therefore inhibition of Reelin (RELN, Accession XM\_168628), a gene which regulates microtubule function in neurons and neuronal migration. Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RELN. The function of RELN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655) is another VGAM1903 host target gene. SELL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELL BINDING SITE, designated SEQ ID:6315, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62884] Another function of VGAM1903 is therefore inhibition of Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655), a gene which is a cell surface adhesion protein. Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELL. The function of SELL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM374. WW Domain Containing Oxidoreductase (WWOX, Accession NM\_016373) is another VGAM1903 host target gene. WWOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WWOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWOX BINDING SITE, designated SEQ ID:18505, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62885] Another function of VGAM1903 is therefore inhibition of WW Domain Containing Oxidoreductase (WWOX, Accession NM\_016373), a gene which involves in protein-

protein interactions and may contribute to the biologic consequences of DNA instability. Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWOX. The function of WWOX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644.DKFZP434C131 (Accession XM\_044630) is another VGAM1903 host target gene. DKFZP434C131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C131 BINDING SITE, designated SEQ ID:34242, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62886] Another function of VGAM1903 is therefore inhibition of DKFZP434C131 (Accession XM\_044630). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C131. DKFZP564K0322 (Accession

NM\_032040) is another VGAM1903 host target gene. DKFZP564K0322 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564K0322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564K0322 BINDING SITE, designated SEQ ID:25739, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62887] Another function of VGAM1903 is therefore inhibition of DKFZP564K0322 (Accession NM\_032040). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564K0322. F-box Only Protein 21 (FBXO21, Accession NM\_033624) is another VGAM1903 host target gene. FBXO21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO21 BINDING SITE, designated SEQ ID:27322, to the nucleotide sequence of VGAM1903 RNA,

herein designated VGAM RNA, also designated SEQ ID:4614.

[62888] Another function of VGAM1903 is therefore inhibition of F-box Only Protein 21 (FBXO21, Accession NM\_033624). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO21. FLJ30927 (Accession NM\_144690) is another VGAM1903 host target gene. FLJ30927 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ30927, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30927 BINDING SITE, designated SEQ ID:29509, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62889] Another function of VGAM1903 is therefore inhibition of FLJ30927 (Accession NM\_144690). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30927. KIAA1866 (Accession XM\_027658) is another VGAM1903 host target gene. KIAA1866 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1866 BINDING SITE, designated SEQ ID:30553, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62890] Another function of VGAM1903 is therefore inhibition of KIAA1866 (Accession XM\_027658). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1866. KIAA1954 (Accession XM\_085375) is another VGAM1903 host target gene. KIAA1954 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1954 BINDING SITE, designated SEQ ID:38094, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62891] Another function of VGAM1903 is therefore inhibition of

KIAA1954 (Accession XM\_085375). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1954. MGC21675 (Accession NM\_052861) is another VGAM1903 host target gene. MGC21675 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC21675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21675 BINDING SITE, designated SEQ ID:27442, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62892] Another function of VGAM1903 is therefore inhibition of MGC21675 (Accession NM\_052861). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21675. TBDN100 (Accession NM\_025085) is another VGAM1903 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24700, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62893] Another function of VGAM1903 is therefore inhibition of TBDN100 (Accession NM\_025085). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. LOC145815 (Accession XM\_096874) is another VGAM1903 host target gene. LOC145815 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145815 BINDING SITE, designated SEQ ID:40601, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62894] Another function of VGAM1903 is therefore inhibition of LOC145815 (Accession XM\_096874). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145815. LOC164382 (Accession XM\_104390) is an-

other VGAM1903 host target gene. LOC164382 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164382 BINDING SITE, designated SEQ ID:42162, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62895] Another function of VGAM1903 is therefore inhibition of LOC164382 (Accession XM\_104390). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164382. LOC200169 (Accession XM\_117200) is another VGAM1903 host target gene. LOC200169 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200169 BINDING SITE, designated SEQ ID:43282, to the nucleotide sequence of VGAM1903 RNA, herein designated VGAM RNA, also designated SEQ ID:4614.

[62896] Another function of VGAM1903 is therefore inhibition of LOC200169 (Accession XM\_117200). Accordingly, utilities of VGAM1903 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200169. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1904 (VGAM1904) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62897] VGAM1904 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1904 was detected is described hereinabove with reference to Figs. 1–8.

[62898] VGAM1904 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Respiratory Syncytial Virus. VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62899] VGAM1904 gene encodes a VGAM1904 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1904 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1904 precursor RNA is designated SEQ ID:1890, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1890 is located at position 8364 relative to the genome of Respiratory Syncytial Virus.

[62900] VGAM1904 precursor RNA folds onto itself, forming VGAM1904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1904 folded precursor RNA into VGAM1904 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1904 RNA is designated SEQ ID:4615, and is provided hereinbelow with reference to the sequence listing part.

[62902] VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1904 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[62903] VGAM1904 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1904 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1904 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62904] The complementary binding of VGAM1904 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1904 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1904 host target RNA into VGAM1904 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62905] It is appreciated that VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1904 host target genes. The mRNA of each one of this plurality of VGAM1904 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1904 RNA, herein designated VGAM RNA, and which when bound by VGAM1904 RNA causes inhibition of translation of respective one or more VGAM1904 host target proteins.

[62906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1904 gene, herein designated VGAM GENE, on one or more VGAM1904 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62907] It is yet further appreciated that a function of VGAM1904 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1904 include diagnosis, prevention and treatment of viral infection by Respiratory Syncytial Virus. Specific functions, and accordingly utilities, of VGAM1904 correlate with, and may be deduced from, the identity of the host target genes which VGAM1904 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62908] Nucleotide sequences of the VGAM1904 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1904 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1904 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1904 are further described hereinbelow with reference to Table 1.

[62909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1904 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1904 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[62910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1904 gene, herein designated VGAM is inhibition of expression of VGAM1904 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1904 correlate with, and may be deduced from, the identity of the target genes which VGAM1904 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62911] FLJ20034 (Accession NM\_017630) is a VGAM1904 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19130, to the nucleotide sequence of VGAM1904 RNA, herein designated VGAM RNA, also designated SEQ ID:4615.

[62912] A function of VGAM1904 is therefore inhibition of FLJ20034 (Accession NM\_017630). Accordingly, utilities of VGAM1904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20034. KIAA0534 (Accession XM\_049349) is another VGAM1904 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35379, to the nucleotide sequence of VGAM1904 RNA, herein designated VGAM RNA, also designated SEQ ID:4615.

[62913] Another function of VGAM1904 is therefore inhibition of KIAA0534 (Accession XM\_049349). Accordingly, utilities of VGAM1904 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1905 (VGAM1905) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62914] VGAM1905 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1905 was detected is described hereinabove with reference to Figs. 1–8.

[62915] VGAM1905 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai Virus. VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62916] VGAM1905 gene encodes a VGAM1905 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1905 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1905 precursor RNA is designated SEQ ID:1891, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1891 is located at position 5191 relative to the genome of Sendai Virus.

[62917] VGAM1905 precursor RNA folds onto itself, forming VGAM1905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62918] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1905 folded precursor RNA into VGAM1905 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM1905 RNA is designated SEQ ID:4616, and is provided hereinbelow with reference to the sequence listing part.

[62919] VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1905 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62920] VGAM1905 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1905 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1905 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1905 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62921] The complementary binding of VGAM1905 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1905 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1905 host target RNA into VGAM1905 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62922] It is appreciated that VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1905 host target genes. The mRNA of each one of this plurality of VGAM1905 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1905 RNA, herein designated VGAM RNA, and which when bound by VGAM1905 RNA causes inhibition of translation of respective one or more VGAM1905 host target proteins.

[62923] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1905 gene, herein designated VGAM GENE, on one or more VGAM1905 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62924] It is yet further appreciated that a function of VGAM1905 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of viral infection by Sendai Virus. Specific functions, and accordingly utilities, of VGAM1905 correlate with, and may be deduced from, the identity of the host target genes which VGAM1905 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62925] Nucleotide sequences of the VGAM1905 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1905 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1905 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1905 are further described hereinbelow with reference to Table 1.

[62926] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1905 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1905 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62927] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1905 gene, herein designated VGAM is inhibition of expression of VGAM1905 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1905 correlate with, and may be deduced from, the identity of the target genes which VGAM1905 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62928] Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082) is a VGAM1905 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5530, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62929] A function of VGAM1905 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. Pyrimidinergic Receptor P2Y, G-protein Coupled, 6 (P2RY6, Accession NM\_004154) is another VGAM1905 host target gene. P2RY6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RY6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RY6 BINDING SITE, designated SEQ ID:10356, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62930] Another function of VGAM1905 is therefore inhibition of Pyrimidinergic Receptor P2Y, G-protein Coupled, 6

(P2RY6, Accession NM\_004154), a gene which mediates cellular responses to nucleotides. Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RY6. The function of P2RY6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445. Transmembrane Protein 2 (TMEM2, Accession NM\_013390) is another VGAM1905 host target gene. TMEM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEM2 BINDING SITE, designated SEQ ID:15040, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62931] Another function of VGAM1905 is therefore inhibition of Transmembrane Protein 2 (TMEM2, Accession NM\_013390). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEM2. Chromosome 13

Open Reading Frame 1 (C13orf1, Accession NM\_020456) is another VGAM1905 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21692, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62932] Another function of VGAM1905 is therefore inhibition of Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM\_020456). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1. FLJ22390 (Accession NM\_022746) is another VGAM1905 host target gene. FLJ22390 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22390 BINDING SITE, designated SEQ ID:22956, to the nucleotide sequence of VGAM1905

RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62933] Another function of VGAM1905 is therefore inhibition of FLJ22390 (Accession NM\_022746). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22390. KIAA0748 (Accession NM\_014796) is another VGAM1905 host target gene. KIAA0748 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0748 BINDING SITE, designated SEQ ID:16699, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62934] Another function of VGAM1905 is therefore inhibition of KIAA0748 (Accession NM\_014796). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0748. KIAA1317 (Accession XM\_098368) is another VGAM1905 host target gene. KIAA1317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1317 BINDING SITE, designated SEQ ID:41628, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62935] Another function of VGAM1905 is therefore inhibition of KIAA1317 (Accession XM\_098368). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1317. LOC122792 (Accession NM\_145251) is another VGAM1905 host target gene. LOC122792 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122792, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122792 BINDING SITE, designated SEQ ID:29762, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62936] Another function of VGAM1905 is therefore inhibition of LOC122792 (Accession NM\_145251). Accordingly, utilities

of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122792. LOC148697 (Accession XM\_086276) is another VGAM1905 host target gene. LOC148697 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148697, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148697 BINDING SITE, designated SEQ ID:38571, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62937] Another function of VGAM1905 is therefore inhibition of LOC148697 (Accession XM\_086276). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148697. LOC221964 (Accession XM\_168342) is another VGAM1905 host target gene. LOC221964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221964 BINDING SITE, designated SEQ ID:45112, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62938] Another function of VGAM1905 is therefore inhibition of LOC221964 (Accession XM\_168342). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221964. LOC51134 (Accession NM\_016122) is another VGAM1905 host target gene. LOC51134 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51134 BINDING SITE, designated SEQ ID:18210, to the nucleotide sequence of VGAM1905 RNA, herein designated VGAM RNA, also designated SEQ ID:4616.

[62939] Another function of VGAM1905 is therefore inhibition of LOC51134 (Accession NM\_016122). Accordingly, utilities of VGAM1905 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1906 (VGAM1906) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62940] VGAM1906 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1906 was detected is described hereinabove with reference to Figs. 1–8.

[62941] VGAM1906 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai Virus. VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62942] VGAM1906 gene encodes a VGAM1906 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1906 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1906 precursor RNA is designated SEQ ID:1892, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1892 is located at position 15052 relative to the genome of Sendai Virus.

[62943] VGAM1906 precursor RNA folds onto itself, forming VGAM1906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62944] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1906 folded precursor RNA into VGAM1906 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1906 RNA is designated SEQ ID:4617, and is provided hereinbelow with reference to the sequence listing part.

[62945] VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1906 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1906 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[62946] VGAM1906 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1906 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1906 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62947] The complementary binding of VGAM1906 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1906 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1906 host target RNA into VGAM1906 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62948] It is appreciated that VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1906 host target genes. The mRNA of each one of this plurality of VGAM1906 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1906 RNA, herein designated VGAM RNA, and which when bound by VGAM1906 RNA causes inhibition of translation of respective one or more VGAM1906 host target proteins.

[62949] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1906 gene, herein designated VGAM GENE, on one or more VGAM1906 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62950] It is yet further appreciated that a function of VGAM1906 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1906 include diagnosis, prevention and treatment of viral infection by Sendai Virus. Specific functions, and accordingly utilities, of VGAM1906 correlate with, and may be deduced from, the identity of the host

target genes which VGAM1906 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62951] Nucleotide sequences of the VGAM1906 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1906 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1906 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1906 are further described hereinbelow with reference to Table 1.

[62952] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1906 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1906 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62953] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1906 gene, herein designated VGAM is inhibition of expression of VGAM1906 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1906 correlate with, and may be deduced from, the identity of the target genes which VGAM1906

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62954] Glypican 4 (GPC4, Accession NM\_001448) is a VGAM1906 host target gene. GPC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC4 BINDING SITE, designated SEQ ID:7178, to the nucleotide sequence of VGAM1906 RNA, herein designated VGAM RNA, also designated SEQ ID:4617.

[62955] A function of VGAM1906 is therefore inhibition of Glypican 4 (GPC4, Accession NM\_001448), a gene which may play a role in growth control and cell division. Accordingly, utilities of VGAM1906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC4. The function of GPC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM538.LOC221540 (Accession XM\_168133) is another VGAM1906 host target gene. LOC221540 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LOC221540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221540 BINDING SITE, designated SEQ ID:45042, to the nucleotide sequence of VGAM1906 RNA, herein designated VGAM RNA, also designated SEQ ID:4617.

[62956] Another function of VGAM1906 is therefore inhibition of LOC221540 (Accession XM\_168133). Accordingly, utilities of VGAM1906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221540. LOC257545 (Accession XM\_175217) is another VGAM1906 host target gene. LOC257545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257545 BINDING SITE, designated SEQ ID:46690, to the nucleotide sequence of VGAM1906 RNA, herein designated VGAM RNA, also designated SEQ ID:4617.

[62957] Another function of VGAM1906 is therefore inhibition of

LOC257545 (Accession XM\_175217). Accordingly, utilities of VGAM1906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257545. LOC257598 (Accession XM\_175295) is another VGAM1906 host target gene. LOC257598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257598 BINDING SITE, designated SEQ ID:46747, to the nucleotide sequence of VGAM1906 RNA, herein designated VGAM RNA, also designated SEQ ID:4617.

[62958] Another function of VGAM1906 is therefore inhibition of LOC257598 (Accession XM\_175295). Accordingly, utilities of VGAM1906 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1907 (VGAM1907) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[62959] VGAM1907 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1907 was detected is described hereinabove with reference to Figs. 1–8.

[62960] VGAM1907 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62961] VGAM1907 gene encodes a VGAM1907 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1907 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1907 precursor RNA is designated SEQ ID:1893, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1893 is located at position 7040 relative to the genome of Human Parainfluenza Virus 3.

[62962] VGAM1907 precursor RNA folds onto itself, forming VGAM1907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62963] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1907 folded precursor RNA into VGAM1907 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM1907 RNA is designated SEQ ID:4618, and is provided hereinbelow with reference to the sequence listing part.

[62964] VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1907 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[62965] VGAM1907 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1907 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1907 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[62966] The complementary binding of VGAM1907 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1907 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1907 host target RNA into VGAM1907 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62967] It is appreciated that VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1907 host target genes. The mRNA of each one of this plurality of VGAM1907 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1907 RNA, herein designated VGAM RNA, and which when bound by VGAM1907 RNA causes inhibition of translation of respective one or more VGAM1907 host target proteins.

[62968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1907 gene, herein designated VGAM GENE, on one

or more VGAM1907 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62969] It is yet further appreciated that a function of VGAM1907 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1907 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1907 correlate with, and may be deduced from, the identity of the host target genes which VGAM1907 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62970] Nucleotide sequences of the VGAM1907 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1907 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1907 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1907 are further described hereinbelow with reference to Table 1.

[62971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1907 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1907 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62972] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1907 gene, herein designated VGAM is inhibition of expression of VGAM1907 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1907 correlate with, and may be deduced from, the identity of the target genes which VGAM1907 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62973] KIAA0471 (Accession NM\_014857) is a VGAM1907 host

target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16910, to the nucleotide sequence of VGAM1907 RNA, herein designated VGAM RNA, also designated SEQ ID:4618.

[62974] A function of VGAM1907 is therefore inhibition of KIAA0471 (Accession NM\_014857). Accordingly, utilities of VGAM1907 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1908 (VGAM1908) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[62975] VGAM1908 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1908 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[62976] VGAM1908 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[62977] VGAM1908 gene encodes a VGAM1908 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1908 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1908 precursor RNA is designated SEQ ID:1894, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1894 is located at position 8620 relative to the genome of Human Parainfluenza Virus 3.

[62978] VGAM1908 precursor RNA folds onto itself, forming VGAM1908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[62979] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1908 folded precursor RNA into VGAM1908 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1908 RNA is designated SEQ ID:4619, and is provided hereinbelow with reference to the sequence listing part.

[62980] VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1908 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[62981] VGAM1908 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1908 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1908 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1908 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[62982] The complementary binding of VGAM1908 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1908 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1908 host target RNA into VGAM1908 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[62983] It is appreciated that VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1908 host target genes. The mRNA of each one of this plurality of VGAM1908 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1908 RNA, herein designated VGAM RNA, and which when bound by VGAM1908 RNA causes inhibition of translation of respective one or more VGAM1908 host target proteins.

[62984] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1908 gene, herein designated VGAM GENE, on one or more VGAM1908 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[62985] It is yet further appreciated that a function of VGAM1908 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1908 correlate with, and may be deduced from, the identity of the host target genes which VGAM1908 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[62986] Nucleotide sequences of the VGAM1908 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1908 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1908 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1908 are further described hereinbelow with reference to Table 1.

[62987] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1908 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1908 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[62988] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1908 gene, herein designated VGAM is inhibition of expression of VGAM1908 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1908 correlate with, and may be deduced from, the identity of the target genes which VGAM1908 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[62989] Solute Carrier Family 29 (nucleoside transporters), Member 1 (SLC29A1, Accession NM\_004955) is a VGAM1908 host target gene. SLC29A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC29A1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC29A1 BINDING SITE, designated SEQ ID:11401, to the nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, also designated SEQ ID:4619.

[62990] A function of VGAM1908 is therefore inhibition of Solute Carrier Family 29 (nucleoside transporters), Member 1 (SLC29A1, Accession NM\_004955), a gene which mediates both influx and efflux of nucleosides across the membrane. Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC29A1. The function of SLC29A1 has been established by previous studies. An essential component of the action of nucleoside analog drugs used in anticancer therapies is the mediated uptake of the drug across the plasma membrane and into the cell. This is achieved by integral membrane proteins known as nucleoside transporters. There are 2 major families of nucleoside transporters, the concentrative and the equilibrative. The concentrative nucleoside transporters appear to be restricted in their distribution within cells and tissues and also in their selectivity of nucleoside permeants. In con-

trast, the equilibrative nucleoside transporters appear to be widely distributed and have a broad substrate specificity. Griffiths et al. (1997) cloned the cDNA for the prototypic equilibrative transporter ENT1 from human placenta. Choi et al. (2000) cloned and sequenced the mouse Ent1 gene. Northern blot analysis detected expression of Ent1 in all tissues except skeletal muscle, with highest levels in liver, heart, testis, spleen, lung, kidney, and brain.

[62991] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[62992] Griffiths, M.; Beaumont, N.; Yao, S. Y. M.; Sundaram, M.; Boumah, C. E.; Davies, A.; Kwong, F. Y. P.; Coe, I.; Cass, C. E.; Young, J. D.; Baldwin, S. A. : Cloning of a human nucleoside transporter implicated in the cellular uptake of adenosine and chemotherapeutic drugs. *Nature Med.* 3: 89–94, 1997. ; and

[62993] Choi, D.-S.; Handa, M.; Young, H.; Gordon, A. S.; Diamond, I.; Messing, R. O. : Genomic organization and expression of the mouse equilibrative, nitrobenzylthioinosine-sensitive nucleoside.

[62994] Further studies establishing the function and utilities of

SLC29A1 are found in John Hopkins OMIM database record ID 602193, and in cited publications numbered 5854–5856 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM\_000351) is another VGAM1908 host target gene. STS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by STS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STS BINDING SITE, designated SEQ ID:5912, to the nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, also designated SEQ ID:4619.

[62995] Another function of VGAM1908 is therefore inhibition of Steroid Sulfatase (microsomal), Arylsulfatase C, Isozyme S (STS, Accession NM\_000351). Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STS. KIAA0543 (Accession XM\_044213) is another VGAM1908 host target gene. KIAA0543 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0543, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0543 BINDING SITE, designated SEQ ID:34179, to the nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, also designated SEQ ID:4619.

[62996] Another function of VGAM1908 is therefore inhibition of KIAA0543 (Accession XM\_044213). Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0543. UMP-CMPK (Accession NM\_016308) is another VGAM1908 host target gene. UMP-CMPK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UMP-CMPK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UMP-CMPK BINDING SITE, designated SEQ ID:18427, to the nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, also designated SEQ ID:4619.

[62997] Another function of VGAM1908 is therefore inhibition of UMP-CMPK (Accession NM\_016308). Accordingly, utilities of VGAM1908 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with UMP-CMPK. LOC152441 (Accession XM\_098230) is another VGAM1908 host target gene. LOC152441 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC152441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152441 BINDING SITE, designated SEQ ID:41507, to the nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, also designated SEQ ID:4619.

[62998] Another function of VGAM1908 is therefore inhibition of LOC152441 (Accession XM\_098230). Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152441. LOC51313 (Accession NM\_016613) is another VGAM1908 host target gene. LOC51313 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51313 BINDING SITE, designated SEQ ID:18721, to the

nucleotide sequence of VGAM1908 RNA, herein designated VGAM RNA, also designated SEQ ID:4619.

[62999] Another function of VGAM1908 is therefore inhibition of LOC51313 (Accession NM\_016613). Accordingly, utilities of VGAM1908 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51313. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1909 (VGAM1909) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63000] VGAM1909 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1909 was detected is described hereinabove with reference to Figs. 1–8.

[63001] VGAM1909 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63002] VGAM1909 gene encodes a VGAM1909 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1909 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1909 precursor RNA is designated SEQ ID:1895, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1895 is located at position 5850 relative to the genome of Human Parainfluenza Virus 3.

[63003] VGAM1909 precursor RNA folds onto itself, forming VGAM1909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63004] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1909 folded precursor RNA into VGAM1909 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1909 RNA is designated SEQ ID:4620, and is provided hereinbelow with reference to the sequence listing part.

[63005] VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1909 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63006] VGAM1909 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1909 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1909 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63007] The complementary binding of VGAM1909 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1909 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1909 host target RNA into VGAM1909 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63008] It is appreciated that VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1909 host target genes. The mRNA of each one of this plurality of VGAM1909 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1909 RNA, herein designated VGAM RNA, and which when bound by VGAM1909 RNA causes inhibition of translation of respective one or more VGAM1909 host target proteins.

[63009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1909 gene, herein designated VGAM GENE, on one or more VGAM1909 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[63010] It is yet further appreciated that a function of VGAM1909 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1909 correlate with, and may be deduced from, the identity of the host target genes which VGAM1909 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63011] Nucleotide sequences of the VGAM1909 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1909 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1909 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1909 are further described hereinbelow with reference to Table 1.

[63012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1909 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1909 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63013] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1909 gene, herein designated VGAM is inhibition of expression of VGAM1909 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1909 correlate with, and may be deduced from, the identity of the target genes which VGAM1909 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63014] High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is a VGAM1909 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9560, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63015] A function of VGAM1909 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession

NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Myelin Protein Zero (Charcot-Marie-Tooth neuropathy 1B) (MPZ, Accession NM\_000530) is another VGAM1909 host target gene. MPZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPZ BINDING SITE, designated SEQ ID:6129, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63016] Another function of VGAM1909 is therefore inhibition of Myelin Protein Zero (Charcot-Marie-Tooth neuropathy 1B) (MPZ, Accession NM\_000530). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MPZ. Nucleoporin 98kDa (NUP98, Accession NM\_016320) is another VGAM1909 host target gene. NUP98 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUP98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP98 BINDING SITE, designated SEQ ID:18438, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63017] Another function of VGAM1909 is therefore inhibition of Nucleoporin 98kDa (NUP98, Accession NM\_016320), a gene which functions in the nuclear transport of protein and RNA. Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP98. The function of NUP98 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.FLJ20232 (Accession NM\_019008) is another VGAM1909 host target gene. FLJ20232 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by FLJ20232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21081, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63018] Another function of VGAM1909 is therefore inhibition of FLJ20232 (Accession NM\_019008). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. FLJ32389 (Accession NM\_144617) is another VGAM1909 host target gene. FLJ32389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32389 BINDING SITE, designated SEQ ID:29433, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63019] Another function of VGAM1909 is therefore inhibition of FLJ32389 (Accession NM\_144617). Accordingly, utilities of

VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32389. KIAA1855 (Accession XM\_166453) is another VGAM1909 host target gene. KIAA1855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1855 BINDING SITE, designated SEQ ID:44351, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63020] Another function of VGAM1909 is therefore inhibition of KIAA1855 (Accession XM\_166453). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1855. LOC144231 (Accession XM\_096561) is another VGAM1909 host target gene. LOC144231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC144231 BINDING SITE, designated SEQ ID:40391, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63021] Another function of VGAM1909 is therefore inhibition of LOC144231 (Accession XM\_096561). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144231. LOC161823 (Accession XM\_091156) is another VGAM1909 host target gene. LOC161823 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161823, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161823 BINDING SITE, designated SEQ ID:40034, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63022] Another function of VGAM1909 is therefore inhibition of LOC161823 (Accession XM\_091156). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161823. LOC201191 (Accession XM\_117058) is another VGAM1909 host target gene. LOC201191 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201191 BINDING SITE, designated SEQ ID:43214, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63023] Another function of VGAM1909 is therefore inhibition of LOC201191 (Accession XM\_117058). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201191. LOC220776 (Accession XM\_043388) is another VGAM1909 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33931, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63024] Another function of VGAM1909 is therefore inhibition of

LOC220776 (Accession XM\_043388). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC91409 (Accession XM\_038298) is another VGAM1909 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32802, to the nucleotide sequence of VGAM1909 RNA, herein designated VGAM RNA, also designated SEQ ID:4620.

[63025] Another function of VGAM1909 is therefore inhibition of LOC91409 (Accession XM\_038298). Accordingly, utilities of VGAM1909 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1910 (VGAM1910) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[63026] VGAM1910 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1910 was detected is described hereinabove with reference to Figs. 1–8.

[63027] VGAM1910 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63028] VGAM1910 gene encodes a VGAM1910 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1910 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1910 precursor RNA is designated SEQ ID:1896, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1896 is located at position 8937 relative to the genome of Human Parainfluenza Virus 3.

[63029] VGAM1910 precursor RNA folds onto itself, forming VGAM1910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63030] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1910 folded precursor RNA into VGAM1910 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1910 RNA is designated SEQ ID:4621, and is provided hereinbelow with reference to the sequence listing part.

[63031] VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1910 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[63032] VGAM1910 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1910 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1910 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[63033] The complementary binding of VGAM1910 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1910 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1910 host target RNA into VGAM1910 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63034] It is appreciated that VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1910 host target genes. The mRNA of each one of this plurality of VGAM1910 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1910 RNA, herein designated VGAM RNA, and which when bound by VGAM1910 RNA causes inhibition of translation of respective one or more VGAM1910 host target proteins.

[63035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1910 gene, herein designated VGAM GENE, on one

or more VGAM1910 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63036] It is yet further appreciated that a function of VGAM1910 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1910 correlate with, and may be deduced from, the identity of the host target genes which VGAM1910 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63037] Nucleotide sequences of the VGAM1910 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1910 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1910 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1910 are further described hereinbelow with reference to Table 1.

[63038] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1910 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1910 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63039] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1910 gene, herein designated VGAM is inhibition of expression of VGAM1910 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1910 correlate with, and may be deduced from, the identity of the target genes which VGAM1910 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63040] Fibronectin Leucine Rich Transmembrane Protein 2

(FLRT2, Accession NM\_013231) is a VGAM1910 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14884, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63041] A function of VGAM1910 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Folate Receptor 1 (adult) (FOLR1, Accession NM\_016730) is another VGAM1910 host target gene. FOLR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

FOLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOLR1 BINDING SITE, designated SEQ ID:18783, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63042] Another function of VGAM1910 is therefore inhibition of Folate Receptor 1 (adult) (FOLR1, Accession NM\_016730), a gene which binds and initiates transport of folate and methotrexate. Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOLR1. The function of FOLR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM399. Lipin 1 (LPIN1, Accession XM\_041136) is another VGAM1910 host target gene. LPIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN1 BIND-

ING SITE, designated SEQ ID:33464, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63043] Another function of VGAM1910 is therefore inhibition of Lipin 1 (LPIN1, Accession XM\_041136), a gene which is involved in adipocyte differentiation (by similarity). Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN1. The function of LPIN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Phosphatidylinositol Transfer Protein, Beta (PITPNB, Accession NM\_012399) is another VGAM1910 host target gene. PITPNB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PITPNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PITPNB BINDING SITE, designated SEQ ID:14765, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63044] Another function of VGAM1910 is therefore inhibition of

Phosphatidylinositol Transfer Protein, Beta (PITPNB, Accession NM\_012399), a gene which catalyzes the transfer of ptdins and phosphatidylcholine between membranes. Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PITPNB. The function of PITPNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1016. EDR1 (Accession NM\_004426) is another VGAM1910 host target gene. EDR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR1 BINDING SITE, designated SEQ ID:10701, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63045] Another function of VGAM1910 is therefore inhibition of EDR1 (Accession NM\_004426). Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR1. FLJ10201 (Accession NM\_018023) is another VGAM1910

host target gene. FLJ10201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10201 BINDING SITE, designated SEQ ID:19763, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63046] Another function of VGAM1910 is therefore inhibition of FLJ10201 (Accession NM\_018023). Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10201. KIAA1350 (Accession XM\_052597) is another VGAM1910 host target gene. KIAA1350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1350 BINDING SITE, designated SEQ ID:35999, to the nucleotide sequence of VGAM1910 RNA, herein designated VGAM RNA, also designated SEQ ID:4621.

[63047] Another function of VGAM1910 is therefore inhibition of KIAA1350 (Accession XM\_052597). Accordingly, utilities of VGAM1910 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1350. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1911 (VGAM1911) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63048] VGAM1911 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1911 was detected is described hereinabove with reference to Figs. 1–8.

[63049] VGAM1911 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63050] VGAM1911 gene encodes a VGAM1911 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1911 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1911 precursor RNA is designated SEQ ID:1897, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1897 is located at position 1061 relative to the genome of Human Parainfluenza Virus 3.

[63051] VGAM1911 precursor RNA folds onto itself, forming VGAM1911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63052] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1911 folded precursor RNA into VGAM1911 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1911 RNA is designated SEQ ID:4622, and is provided hereinbelow with reference to the sequence listing part.

[63053] VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1911 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[63054] VGAM1911 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1911 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1911 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63055] The complementary binding of VGAM1911 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1911 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1911 host target RNA into VGAM1911 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63056] It is appreciated that VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1911 host target genes. The mRNA of each one of this plurality of VGAM1911 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1911 RNA, herein designated VGAM RNA, and which when bound by VGAM1911 RNA causes inhibition of translation of respective one or more VGAM1911 host target proteins.

[63057] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1911 gene, herein designated VGAM GENE, on one or more VGAM1911 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63058] It is yet further appreciated that a function of VGAM1911 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1911 correlate with, and may be deduced from, the identity of the host target genes which VGAM1911 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63059] Nucleotide sequences of the VGAM1911 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1911 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1911 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1911 are further described hereinbelow with reference to Table 1.

[63060] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1911 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1911 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[63061] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1911 gene, herein designated VGAM is inhibition of expression of VGAM1911 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1911 correlate with, and may be deduced from, the identity of the target genes which VGAM1911 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63062] Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007294) is a VGAM1911 host target gene. BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BRCA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10, designated SEQ ID:14166, SEQ ID:14172, SEQ ID:14178, SEQ ID:14185, SEQ ID:14191, SEQ ID:14197, SEQ ID:14205, SEQ ID:14211, SEQ ID:14217 and SEQ ID:14223 respectively, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63063] A function of VGAM1911 is therefore inhibition of Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007294). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Carbonic Anhydrase III, Muscle Specific (CA3, Accession NM\_005181) is another VGAM1911 host target gene. CA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA3 BINDING SITE, designated SEQ ID:11680, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63064] Another function of VGAM1911 is therefore inhibition of Carbonic Anhydrase III, Muscle Specific (CA3, Accession NM\_005181), a gene which has a muscle-specific function of reversible hydration of carbon dioxide. Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA3. The function of CA3 has been established by previous studies. Carbonic anhydrases (CAs) are a family

of zinc metalloenzymes. Carbonic anhydrase III is found in high concentration in muscle. It shows relatively poor hydratase and esterase activities compared to the red cell isozymes CA I (OMIM Ref. No. 114800) and CA II (OMIM Ref. No. 259730), but is similar in subunit structure (monomer) and molecular mass (28 kD). Heath et al. (1985) explored the use of CA III in conjunction with creatine kinase detection of the carrier state for Duchenne muscular dystrophy.

[63065] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63066] Heath, R.; Carter, N. D.; Jeffery, S.; Edwards, R. J.; Watts, D. C.; Watts, R. L. : Evaluation of carrier detection of Duchenne muscular dystrophy using carbonic anhydrase III and creatine kinase. Am. J. Med. Genet. 21: 291–296, 1985. ; and

[63067] Edwards, Y. H.; Lloyd, J. C.; Parkar, M.; Povey, S. : The gene for human muscle specific carbonic anhydrase (CAIII) is assigned to chromosome 8. Ann. Hum. Genet. 50: 41–47, 1986.

[63068] Further studies establishing the function and utilities of CA3 are found in John Hopkins OMIM database record ID

114750, and in cited publications numbered 3710–371 and 11874 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NM\_004513) is another VGAM1911 host target gene. IL16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL16 BINDING SITE, designated SEQ ID:10841, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63069] Another function of VGAM1911 is therefore inhibition of Interleukin 16 (lymphocyte chemoattractant factor) (IL16, Accession NM\_004513), a gene which modulates T-cell activation. Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL16. The function of IL16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

## VGAM819.Meningioma Expressed Antigen 5

(hyaluronidase) (MGEA5, Accession NM\_012215) is another VGAM1911 host target gene. MGEA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGEA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA5 BINDING SITE, designated SEQ ID:14520, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63070] Another function of VGAM1911 is therefore inhibition of Meningioma Expressed Antigen 5 (hyaluronidase) (MGEA5, Accession NM\_012215), a gene which has a hyaluronidase activity. Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA5. The function of MGEA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM801.Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409) is another VGAM1911 host target gene. CCR6 BINDING SITE is HOST TARGET binding site

found in the 5' untranslated region of mRNA encoded by CCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE, designated SEQ ID:25375, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63071] Another function of VGAM1911 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. DJ167A19.1 (Accession NM\_018982) is another VGAM1911 host target gene. DJ167A19.1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ167A19.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ167A19.1 BINDING SITE, designated SEQ ID:21052, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63072] Another function of VGAM1911 is therefore inhibition of

DJ167A19.1 (Accession NM\_018982). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ167A19.1. FLJ10579 (Accession NM\_018145) is another VGAM1911 host target gene. FLJ10579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10579 BINDING SITE, designated SEQ ID:19946, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63073] Another function of VGAM1911 is therefore inhibition of FLJ10579 (Accession NM\_018145). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10579. FLJ10829 (Accession NM\_018234) is another VGAM1911 host target gene. FLJ10829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10829 BINDING SITE, designated SEQ ID:20181, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63074] Another function of VGAM1911 is therefore inhibition of FLJ10829 (Accession NM\_018234). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10829. FLJ23462 (Accession NM\_024843) is another VGAM1911 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24267, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63075] Another function of VGAM1911 is therefore inhibition of FLJ23462 (Accession NM\_024843). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. KIAA0285 (Accession NM\_014807) is another

VGAM1911 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16756, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63076] Another function of VGAM1911 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. SEC15B (Accession XM\_039570) is another VGAM1911 host target gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:33129, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63077] Another function of VGAM1911 is therefore inhibition of SEC15B (Accession XM\_039570). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC15B. LOC197131 (Accession XM\_113823) is another VGAM1911 host target gene. LOC197131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197131 BINDING SITE, designated SEQ ID:42449, to the nucleotide sequence of VGAM1911 RNA, herein designated VGAM RNA, also designated SEQ ID:4622.

[63078] Another function of VGAM1911 is therefore inhibition of LOC197131 (Accession XM\_113823). Accordingly, utilities of VGAM1911 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197131. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1912 (VGAM1912) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[63079] VGAM1912 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1912 was detected is described hereinabove with reference to Figs. 1–8.

[63080] VGAM1912 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63081] VGAM1912 gene encodes a VGAM1912 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1912 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1912 precursor RNA is designated SEQ ID:1898, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1898 is located at position 12367 relative to the genome of Human Parainfluenza Virus 3.

[63082] VGAM1912 precursor RNA folds onto itself, forming VGAM1912 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63083] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1912 folded precursor RNA into VGAM1912 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1912 RNA is designated SEQ ID:4623, and is provided hereinbelow with reference to the sequence listing part.

[63084] VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1912 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63085] VGAM1912 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1912 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1912 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63086] The complementary binding of VGAM1912 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1912 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1912 host target RNA into VGAM1912 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63087] It is appreciated that VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1912 host target genes. The mRNA of each one of this plurality of VGAM1912 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1912 RNA, herein designated VGAM RNA, and which when bound by VGAM1912 RNA causes inhibition of translation of respective one or more VGAM1912 host target proteins.

[63088] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1912 gene, herein designated VGAM GENE, on one or more VGAM1912 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63089] It is yet further appreciated that a function of VGAM1912 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1912 correlate with, and may be deduced from, the identity of the host target genes which VGAM1912 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[63090] Nucleotide sequences of the VGAM1912 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1912 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1912 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1912 are further described hereinbelow with reference to Table 1.

[63091] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1912 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1912 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63092] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1912 gene, herein designated VGAM is inhibition of expression of VGAM1912 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1912 correlate with, and may be deduced from, the identity of the target genes which VGAM1912 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63093] Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1)

(CDKN1A, Accession NM\_078467) is a VGAM1912 host target gene. CDKN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1A BINDING SITE, designated SEQ ID:27783, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63094] A function of VGAM1912 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 1A (p21, Cip1) (CDKN1A, Accession NM\_078467), a gene which inhibits cyclin-kinase activity and probably serves as the effector of p53 cell cycle control. Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1A. The function of CDKN1A has been established by previous studies. The preferred name and symbol for this gene are cyclin-dependent kinase inhibitor-1A (OMIM Ref. No. CDKN1A). Also referred to as p21 and as CDKN1, this protein inhibits cyclin-kinase activity, is tightly regulated at the

transcriptional level by p53, and probably serves as the effector of p53 cell cycle control. The ability of p53 (OMIM Ref. No. 191170) to activate transcription from specific sequences suggests that genes induced by p53 may mediate its biologic role as a tumor suppressor. Using a subtractive hybridization approach, El-Deiry et al. (1993) identified a gene they called WAF1 (for wildtype p53-activated fragment 1), whose induction was associated with wildtype but not mutant p53 gene expression in a human brain tumor cell line. El-Deiry et al. (1993) found that the sequence, structure, and activation by p53 was conserved in rodents. Introduction of WAF1 cDNA suppressed the growth of human brain, lung, and colon tumor cells in culture. Using a yeast enhancer trap, they identified a p53-binding site 2.4 kb upstream of WAF1 coding sequences. The WAF1 promoter, including this p53-binding site, conferred p53-dependent inducibility upon a heterologous reporter gene. After acceptance of their paper for publication, El-Deiry et al. (1993) learned that Harper et al. (1993) had identified a gene, called CIP1, whose product binds to cyclin complexes and inhibits the function of cyclin-dependent kinases. They found that the sequence of CIP1, described by Harper et

al. (1993) in the same issue of Cell, was identical to that of WAF1. The results provided a dramatic example of the interplay between tumor suppressor genes and the cell cycle.

[63095] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63096] El-Deiry, W. S.; Tokino, T.; Velculescu, V. E.; Levy, D. B.; Parsons, R.; Trent, J. M.; Lin, D.; Mercer, E.; Kinzler, K. W.; Vogelstein, B. : WAF1, a potential mediator of p53 tumor suppression. Cell 75: 817–825, 1993. ; and

[63097] Harper, J. W.; Adami, G. R.; Wei, N.; Keyomarsi, K.; Elledge, S. J. : The p21 Cdk-interacting protein Cip1 is a potent inhibitor of G1 cyclin-dependent kinases. Cell 75: 805–816, 1993.

[63098] Further studies establishing the function and utilities of CDKN1A are found in John Hopkins OMIM database record ID 116899, and in cited publications numbered 4130, 9827–4132, 4342, 10700–4134, 7124–4136, 2969, 1276 and 3140 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome Condensation 1-like (CHC1L, Accession NM\_001268) is another VGAM1912 host target gene.

CHC1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHC1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHC1L BINDING SITE, designated SEQ ID:6930, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63099] Another function of VGAM1912 is therefore inhibition of Chromosome Condensation 1-like (CHC1L, Accession NM\_001268). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHC1L. EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM\_004105) is another VGAM1912 host target gene. EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EFEMP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2, designated SEQ

ID:10318 and SEQ ID:20838 respectively, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63100] Another function of VGAM1912 is therefore inhibition of EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM\_004105). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFEMP1. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634) is another VGAM1912 host target gene. KCNAB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB1 BINDING SITE, designated SEQ ID:30548, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63101] Another function of VGAM1912 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634), a

gene which is the regulatory beta subunit for a shaker-related voltage-gated potassium channel. Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB1. The function of KCNAB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM727. RecQ Protein-like 5 (RECQL5, Accession NM\_004259) is another VGAM1912 host target gene. RECQL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RECQL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:10450, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63102] Another function of VGAM1912 is therefore inhibition of RecQ Protein-like 5 (RECQL5, Accession NM\_004259). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5. Solute Carrier Family 4, Sodium

Bicarbonate Transporter-like, Member 10 (SLC4A10, Accession NM\_022058) is another VGAM1912 host target gene. SLC4A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A10 BINDING SITE, designated SEQ ID:22595, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63103] Another function of VGAM1912 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Transporter-like, Member 10 (SLC4A10, Accession NM\_022058). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A10. Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624) is another VGAM1912 host target gene. VIPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of VIPR1 BINDING SITE, designated SEQ ID:10993, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63104] Another function of VGAM1912 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 1 (VIPR1, Accession NM\_004624), a gene which binds vip and is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR1. The function of VIPR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM548. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375) is another VGAM1912 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33515, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM

RNA, also designated SEQ ID:4623.

[63105] Another function of VGAM1912 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM\_016138) is another VGAM1912 host target gene. COQ7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COQ7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COQ7 BINDING SITE, designated SEQ ID:18224, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63106] Another function of VGAM1912 is therefore inhibition of Coenzyme Q7 Homolog, Ubiquinone (yeast) (COQ7, Accession NM\_016138). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COQ7. DKFZP434B172 (Accession XM\_046264) is another VGAM1912 host target gene. DKFZP434B172 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434B172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B172 BINDING SITE, designated SEQ ID:34703, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63107] Another function of VGAM1912 is therefore inhibition of DKFZP434B172 (Accession XM\_046264). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B172. DKFZP564D0462 (Accession XM\_047080) is another VGAM1912 host target gene. DKFZP564D0462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564D0462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0462 BINDING SITE, designated SEQ ID:34898, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4623.

[63108] Another function of VGAM1912 is therefore inhibition of DKFZP564D0462 (Accession XM\_047080). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0462. FLJ12707 (Accession NM\_022067) is another VGAM1912 host target gene. FLJ12707 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12707 BINDING SITE, designated SEQ ID:22610, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63109] Another function of VGAM1912 is therefore inhibition of FLJ12707 (Accession NM\_022067). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12707. FLJ20081 (Accession NM\_017658) is another VGAM1912 host target gene. FLJ20081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20081, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20081 BINDING SITE, designated SEQ ID:19181, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63110] Another function of VGAM1912 is therefore inhibition of FLJ20081 (Accession NM\_017658). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20081. FLJ23499 (Accession NM\_022761) is another VGAM1912 host target gene. FLJ23499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23499 BINDING SITE, designated SEQ ID:23006, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63111] Another function of VGAM1912 is therefore inhibition of FLJ23499 (Accession NM\_022761). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23499. KIAA0759 (Accession XM\_041090) is another VGAM1912 host target gene. KIAA0759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0759 BINDING SITE, designated SEQ ID:33442, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63112] Another function of VGAM1912 is therefore inhibition of KIAA0759 (Accession XM\_041090). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0759. KIAA1908 (Accession XM\_055834) is another VGAM1912 host target gene. KIAA1908 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1908 BINDING SITE, designated SEQ ID:36337, to the

nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63113] Another function of VGAM1912 is therefore inhibition of KIAA1908 (Accession XM\_055834). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1908. Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609) is another VGAM1912 host target gene. MAP3K2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:13385, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63114] Another function of VGAM1912 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2. PP1665 (Accession NM\_030792) is another

VGAM1912 host target gene. PP1665 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PP1665, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1665 BINDING SITE, designated SEQ ID:25094, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63115] Another function of VGAM1912 is therefore inhibition of PP1665 (Accession NM\_030792). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1665. PRO1728 (Accession NM\_018505) is another VGAM1912 host target gene. PRO1728 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1728 BINDING SITE, designated SEQ ID:20571, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63116] Another function of VGAM1912 is therefore inhibition of PRO1728 (Accession NM\_018505). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1728. LOC134266 (Accession XM\_059701) is another VGAM1912 host target gene. LOC134266 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC134266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134266 BINDING SITE, designated SEQ ID:37073, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63117] Another function of VGAM1912 is therefore inhibition of LOC134266 (Accession XM\_059701). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134266. LOC158314 (Accession XM\_098920) is another VGAM1912 host target gene. LOC158314 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158314, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:41955, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63118] Another function of VGAM1912 is therefore inhibition of LOC158314 (Accession XM\_098920). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158314. LOC90643 (Accession XM\_033145) is another VGAM1912 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90643 BINDING SITE, designated SEQ ID:31856, to the nucleotide sequence of VGAM1912 RNA, herein designated VGAM RNA, also designated SEQ ID:4623.

[63119] Another function of VGAM1912 is therefore inhibition of LOC90643 (Accession XM\_033145). Accordingly, utilities of VGAM1912 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90643. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1913 (VGAM1913) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63120] VGAM1913 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1913 was detected is described hereinabove with reference to Figs. 1–8.

[63121] VGAM1913 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63122] VGAM1913 gene encodes a VGAM1913 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1913 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1913 precursor RNA is designated SEQ ID:1899, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1899 is located at position 8166 relative to the genome of Human Parainfluenza Virus 3.

- [63123] VGAM1913 precursor RNA folds onto itself, forming VGAM1913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [63124] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1913 folded precursor RNA into VGAM1913 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1913 RNA is designated SEQ ID:4624, and is provided hereinbelow with reference to the sequence listing part.

[63125] VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1913 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63126] VGAM1913 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1913 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1913 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63127] The complementary binding of VGAM1913 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1913 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1913 host target RNA into VGAM1913 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63128] It is appreciated that VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1913 host target genes. The mRNA of each one of this plurality of VGAM1913 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1913 RNA, herein designated VGAM RNA, and which when bound by VGAM1913 RNA causes

inhibition of translation of respective one or more VGAM1913 host target proteins.

[63129] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1913 gene, herein designated VGAM GENE, on one or more VGAM1913 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63130] It is yet further appreciated that a function of VGAM1913 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1913 include diagnosis, prevention and

treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1913 correlate with, and may be deduced from, the identity of the host target genes which VGAM1913 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63131] Nucleotide sequences of the VGAM1913 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1913 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1913 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1913 are further described hereinbelow with reference to Table 1.

[63132] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1913 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1913 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63133] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1913 gene, herein designated VGAM is inhibition of expression of VGAM1913 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1913 correlate with, and may be deduced from, the identity of the target genes which VGAM1913 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63134] Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924) is a VGAM1913 host target gene. MEOX2 BINDING SITE1 and MEOX2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEOX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEOX2 BINDING SITE1 and MEOX2 BINDING SITE2, designated SEQ ID:12549 and SEQ ID:12550 respectively, to the nucleotide sequence of VGAM1913 RNA, herein designated VGAM RNA, also designated SEQ ID:4624.

[63135] A function of VGAM1913 is therefore inhibition of Mesenchyme Homeo Box 2 (growth arrest-specific homeo box) (MEOX2, Accession NM\_005924), a gene which roles in mesoderm induction and, somitogenesis, and myogenic and sclerotomal differentiation. Accordingly, utilities of VGAM1913 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MEOX2. The function of MEOX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. KIAA0971 (Accession NM\_014929) is another VGAM1913 host target gene. KIAA0971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0971 BINDING SITE, designated SEQ ID:17224, to the nucleotide sequence of VGAM1913 RNA, herein designated VGAM RNA, also designated SEQ ID:4624.

[63136] Another function of VGAM1913 is therefore inhibition of KIAA0971 (Accession NM\_014929). Accordingly, utilities of VGAM1913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0971. LOC158435 (Accession NM\_138497) is another VGAM1913 host target gene. LOC158435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158435, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158435 BINDING SITE, designated SEQ ID:28845, to the nucleotide sequence of VGAM1913 RNA, herein designated VGAM RNA, also designated SEQ ID:4624.

[63137] Another function of VGAM1913 is therefore inhibition of LOC158435 (Accession NM\_138497). Accordingly, utilities of VGAM1913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158435. LOC220827 (Accession XM\_166052) is another VGAM1913 host target gene. LOC220827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220827 BINDING SITE, designated SEQ ID:43843, to the nucleotide sequence of VGAM1913 RNA, herein designated VGAM RNA, also designated SEQ ID:4624.

[63138] Another function of VGAM1913 is therefore inhibition of LOC220827 (Accession XM\_166052). Accordingly, utilities of VGAM1913 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220827. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1914 (VGAM1914) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63139] VGAM1914 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1914 was detected is described hereinabove with reference to Figs. 1–8.

[63140] VGAM1914 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63141] VGAM1914 gene encodes a VGAM1914 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1914 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1914 precursor RNA is designated SEQ ID:1900, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1900 is located at position 14210 relative to the genome of Human Parainfluenza Virus 3.

- [63142] VGAM1914 precursor RNA folds onto itself, forming VGAM1914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [63143] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1914 folded precursor RNA into VGAM1914 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1914 RNA is designated SEQ ID:4625, and is provided hereinbelow with reference to the sequence listing part.

[63144] VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1914 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63145] VGAM1914 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1914 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1914 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63146] The complementary binding of VGAM1914 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1914 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1914 host target RNA into VGAM1914 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63147] It is appreciated that VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1914 host target genes. The mRNA of each one of this plurality of VGAM1914 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1914 RNA, herein designated VGAM RNA, and which when bound by VGAM1914 RNA causes

inhibition of translation of respective one or more VGAM1914 host target proteins.

[63148] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1914 gene, herein designated VGAM GENE, on one or more VGAM1914 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63149] It is yet further appreciated that a function of VGAM1914 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1914 include diagnosis, prevention and

treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1914 correlate with, and may be deduced from, the identity of the host target genes which VGAM1914 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63150] Nucleotide sequences of the VGAM1914 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1914 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1914 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1914 are further described hereinbelow with reference to Table 1.

[63151] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1914 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1914 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63152] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1914 gene, herein designated VGAM is inhibition of expression of VGAM1914 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1914 correlate with, and may be deduced from, the identity of the target genes which VGAM1914 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63153] Cartilage Associated Protein (CRTAP, Accession NM\_006371) is a VGAM1914 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:13060, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63154] A function of VGAM1914 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM\_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM152. Integrin, Alpha 5 (fibronectin receptor, alpha polypeptide) (ITGA5, Accession XM\_028642) is another VGAM1914 host target gene. ITGA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA5 BINDING SITE, designated SEQ ID:30724, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63155] Another function of VGAM1914 is therefore inhibition of Integrin, Alpha 5 (fibronectin receptor, alpha polypeptide) (ITGA5, Accession XM\_028642), a gene which is receptor for fibronectin and fibrinogen and recognizes the sequence r-g-d in its ligands. Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA5. The function of ITGA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1220. Leptin (obesity homolog, mouse) (LEP, Ac-

cession NM\_000230) is another VGAM1914 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5739, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63156] Another function of VGAM1914 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession NM\_000230). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. SRY (sex determining region Y)-box 4 (SOX4, Accession NM\_003107) is another VGAM1914 host target gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9076, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4625.

[63157] Another function of VGAM1914 is therefore inhibition of SRY (sex determining region Y)-box 4 (SOX4, Accession NM\_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaag-3' motif. Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409. T-cell Leukemia, Homeobox 1 (TLX1, Accession NM\_005521) is another VGAM1914 host target gene. TLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLX1 BINDING SITE, designated SEQ ID:12043, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63158] Another function of VGAM1914 is therefore inhibition of T-cell Leukemia, Homeobox 1 (TLX1, Accession

NM\_005521), a gene which controls the spleen development. Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLX1. The function of TLX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1505. TRHDE (Accession NM\_013381) is another VGAM1914 host target gene. TRHDE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRHDE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRHDE BINDING SITE, designated SEQ ID:15033, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63159] Another function of VGAM1914 is therefore inhibition of TRHDE (Accession NM\_013381). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRHDE. ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577) is another VGAM1914 host target gene. ATP9A BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31074, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63160] Another function of VGAM1914 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM\_032852) is another VGAM1914 host target gene. AUTL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AUTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AUTL1 BINDING SITE, designated SEQ ID:26648, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ

ID:4625.

[63161] Another function of VGAM1914 is therefore inhibition of AUT-like 1, Cysteine Endopeptidase (*S. cerevisiae*) (AUTL1, Accession NM\_032852). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AUTL1. Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM\_133367) is another VGAM1914 host target gene. C6orf33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf33 BINDING SITE, designated SEQ ID:28491, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63162] Another function of VGAM1914 is therefore inhibition of Chromosome 6 Open Reading Frame 33 (C6orf33, Accession NM\_133367). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf33. DK-FZP586N0721 (Accession NM\_015400) is another

VGAM1914 host target gene. DKFZP586N0721 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586N0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586N0721 BINDING SITE, designated SEQ ID:17709, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63163] Another function of VGAM1914 is therefore inhibition of DKFZP586N0721 (Accession NM\_015400). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586N0721. FLJ10450 (Accession NM\_018095) is another VGAM1914 host target gene. FLJ10450 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10450 BINDING SITE, designated SEQ ID:19862, to the nucleotide sequence of VGAM1914 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4625.

[63164] Another function of VGAM1914 is therefore inhibition of FLJ10450 (Accession NM\_018095). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10450. GDNF Family Receptor Alpha 4 (GFRA4, Accession NM\_022139) is another VGAM1914 host target gene. GFRA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFRA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFRA4 BINDING SITE, designated SEQ ID:22701, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63165] Another function of VGAM1914 is therefore inhibition of GDNF Family Receptor Alpha 4 (GFRA4, Accession NM\_022139). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFRA4. KIAA0599 (Accession XM\_085127) is another VGAM1914 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37852, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63166] Another function of VGAM1914 is therefore inhibition of KIAA0599 (Accession XM\_085127). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA0831 (Accession NM\_014924) is another VGAM1914 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:17207, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63167] Another function of VGAM1914 is therefore inhibition of

KIAA0831 (Accession NM\_014924). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. KIAA1493 (Accession XM\_034415) is another VGAM1914 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32095, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63168] Another function of VGAM1914 is therefore inhibition of KIAA1493 (Accession XM\_034415). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KIAA1598 (Accession NM\_018330) is another VGAM1914 host target gene. KIAA1598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1598 BINDING SITE, designated SEQ ID:20332, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63169] Another function of VGAM1914 is therefore inhibition of KIAA1598 (Accession NM\_018330). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1598. MacGAP (Accession NM\_033515) is another VGAM1914 host target gene. MacGAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MacGAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MacGAP BINDING SITE, designated SEQ ID:27291, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63170] Another function of VGAM1914 is therefore inhibition of MacGAP (Accession NM\_033515). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MacGAP. PDZ Domain Containing 2 (PDZD2, Accession

XM\_087705) is another VGAM1914 host target gene.

PDZD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39392, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63171] Another function of VGAM1914 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM\_087705). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. PRO1728 (Accession NM\_018505) is another VGAM1914 host target gene. PRO1728 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO1728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1728 BINDING SITE, designated SEQ ID:20572, to the nucleotide sequence of VGAM1914

RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63172] Another function of VGAM1914 is therefore inhibition of PRO1728 (Accession NM\_018505). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1728. RAB11B, Member RAS Oncogene Family (RAB11B, Accession XM\_058232) is another VGAM1914 host target gene. RAB11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB11B BINDING SITE, designated SEQ ID:36588, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63173] Another function of VGAM1914 is therefore inhibition of RAB11B, Member RAS Oncogene Family (RAB11B, Accession XM\_058232). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB11B. LOC150271 (Accession XM\_097859) is another VGAM1914 host target

gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41173, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63174] Another function of VGAM1914 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC152048 (Accession XM\_098158) is another VGAM1914 host target gene. LOC152048 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152048 BINDING SITE, designated SEQ ID:41428, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63175] Another function of VGAM1914 is therefore inhibition of LOC152048 (Accession XM\_098158). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152048. LOC153883 (Accession XM\_087798) is another VGAM1914 host target gene. LOC153883 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153883, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153883 BINDING SITE, designated SEQ ID:39433, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63176] Another function of VGAM1914 is therefore inhibition of LOC153883 (Accession XM\_087798). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153883. LOC157869 (Accession XM\_088409) is another VGAM1914 host target gene. LOC157869 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157869, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157869 BINDING SITE, designated SEQ ID:39675, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63177] Another function of VGAM1914 is therefore inhibition of LOC157869 (Accession XM\_088409). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157869. LOC196074 (Accession XM\_113647) is another VGAM1914 host target gene. LOC196074 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196074 BINDING SITE, designated SEQ ID:42320, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63178] Another function of VGAM1914 is therefore inhibition of LOC196074 (Accession XM\_113647). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196074. LOC201292 (Accession XM\_113949) is another VGAM1914 host target gene. LOC201292 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201292 BINDING SITE, designated SEQ ID:42561, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63179] Another function of VGAM1914 is therefore inhibition of LOC201292 (Accession XM\_113949). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201292. LOC221763 (Accession XM\_168107) is another VGAM1914 host target gene. LOC221763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221763 BINDING SITE, designated SEQ ID:45035, to the nucleotide sequence of VGAM1914 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4625.

[63180] Another function of VGAM1914 is therefore inhibition of LOC221763 (Accession XM\_168107). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221763. LOC89231 (Accession XM\_166577) is another VGAM1914 host target gene. LOC89231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89231 BINDING SITE, designated SEQ ID:44549, to the nucleotide sequence of VGAM1914 RNA, herein designated VGAM RNA, also designated SEQ ID:4625.

[63181] Another function of VGAM1914 is therefore inhibition of LOC89231 (Accession XM\_166577). Accordingly, utilities of VGAM1914 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1915 (VGAM1915) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63182] VGAM1915 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1915 was detected is described hereinabove with reference to Figs. 1–8.

[63183] VGAM1915 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 3. VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63184] VGAM1915 gene encodes a VGAM1915 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1915 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1915 precursor RNA is designated SEQ ID:1901, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1901 is located at position 225 relative to the genome of Human Parainfluenza Virus 3.

[63185] VGAM1915 precursor RNA folds onto itself, forming

VGAM1915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63186] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1915 folded precursor RNA into VGAM1915 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1915 RNA is designated SEQ ID:4626, and is provided hereinbelow with reference to the sequence listing part.

[63187] VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1915 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63188] VGAM1915 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1915 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1915 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63189] The complementary binding of VGAM1915 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1915 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1915 host target RNA into VGAM1915 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63190] It is appreciated that VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1915 host target genes. The mRNA of each one of this plurality of VGAM1915 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1915 RNA, herein designated VGAM RNA, and which when bound by VGAM1915 RNA causes inhibition of translation of respective one or more VGAM1915 host target proteins.

[63191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1915 gene, herein designated VGAM GENE, on one or more VGAM1915 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63192] It is yet further appreciated that a function of VGAM1915 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 3. Specific functions, and accordingly utilities, of VGAM1915 correlate with, and may be deduced from, the identity of the host target genes which VGAM1915 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63193] Nucleotide sequences of the VGAM1915 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1915 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1915 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1915 are further described hereinbelow with reference to Table 1.

[63194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1915 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1915 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63195] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1915 gene, herein designated VGAM is inhibition of expression of VGAM1915 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1915 correlate with, and may be deduced from, the identity of the target genes which VGAM1915 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63196] Adenosine Deaminase, RNA-specific, B1 (RED1 homolog rat) (ADARB1, Accession NM\_015833) is a VGAM1915 host target gene. ADARB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADARB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADARB1 BINDING SITE,

designated SEQ ID:17949, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63197] A function of VGAM1915 is therefore inhibition of Adenosine Deaminase, RNA-specific, B1 (RED1 homolog rat) (ADARB1, Accession NM\_015833), a gene which RNA editing involves the deamination of adenosines at specific sites. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADARB1. The function of ADARB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1717.B29 (Accession NM\_031939) is another VGAM1915 host target gene. B29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B29 BINDING SITE, designated SEQ ID:25683, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63198] Another function of VGAM1915 is therefore inhibition of

B29 (Accession NM\_031939). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B29. B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898) is another VGAM1915 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:23172, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63199] Another function of VGAM1915 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM\_022898). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Calumenin (CALU, Accession NM\_001219) is another VGAM1915 host target gene. CALU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALU, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALU BINDING SITE, designated SEQ ID:6883, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63200] Another function of VGAM1915 is therefore inhibition of Calumenin (CALU, Accession NM\_001219), a gene which binds 7 calcium ions with a low affinity with unidentified function. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALU. The function of CALU and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM253.Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM\_035453) is another VGAM1915 host target gene. CLASP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLASP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLASP2 BINDING SITE, des-

ignated SEQ ID:32267, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63201] Another function of VGAM1915 is therefore inhibition of Cytoplasmic Linker Associated Protein 2 (CLASP2, Accession XM\_035453), a gene which is involved in the regional regulation of microtubule dynamics in motile fibroblasts. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLASP2. The function of CLASP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM897. DUTP Pyrophosphatase (DUT, Accession NM\_001948) is another VGAM1915 host target gene. DUT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUT BINDING SITE, designated SEQ ID:7663, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63202] Another function of VGAM1915 is therefore inhibition of DUTP Pyrophosphatase (DUT, Accession NM\_001948), a gene which is involved in nucleotide metabolism. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUT. The function of DUT has been established by previous studies. Deoxyuridine triphosphate nucleotidohydrolase (dUTPase; EC 3.6.1.23) hydrolyzes dUTP to dUMP and pyrophosphate. Mutations in dUTPase of *E. coli* lead to increased dUTP levels and unusually high levels of dUMP incorporation into DNA during replication and repair which, in turn, causes DNA fragmentation and cell death (Lindahl, 1982; el-Hajj et al., 1988). Presumably for this reason, null mutants of dUTPase in yeast are lethal. A second function for dUTPase is to provide dUMP for synthesis of thymidylate. Canman et al. (1992, 1994) showed that increased dUTPase levels in some cancer cell lines accounted for their resistance to the thymidine synthase inhibitor fluorodeoxyuridine (FUdR). McIntosh et al. (1992) cloned 2 functional human dUTP pyrophosphatases from a cDNA expression library by genetic complementation in *E. coli*. The 2 different-sized cDNAs each contain a single long ORF encoding a 141-amino acid polypeptide with a

calculated molecular mass of 16.6 kD. The human protein shares 35% homology with the *E. coli* dUTPase and 53% with the *Saccharomyces cerevisiae* enzyme. McIntosh et al. (1992) detected expression of the dUTPase gene in a variety of human tissues. Because of its possible essential role in DNA replication, the authors suggested that chemotherapeutics could be designed to target dUTPase in human cancers.

[63203] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63204] Canman, C. E.; Radany, E. H.; Parsels, L. A.; Davis, M. A.; Lawrence, T. S.; Maybaum, J. : Induction of resistance to fluorodeoxyuridine cytotoxicity and DNA damage in human tumor cells by expression of *Escherichia coli* deoxyuridinetriphosphatase. *Cancer Res.* 54: 2296–2298, 1994. ; and

[63205] McIntosh, E. M.; Ager, D. D.; Gadsden, M. H.; Haynes, R. H. : Human dUTP pyrophosphatase: cDNA sequence and potential biological importance of the enzyme. *Proc. Nat. Acad. Sci.* 89: 8020.

[63206] Further studies establishing the function and utilities of DUT are found in John Hopkins OMIM database record ID

601266, and in cited publications numbered 9256–9264 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gardner–Rasheed Feline Sarcoma Viral (v-fgr) Oncogene Homolog (FGR, Accession NM\_005248) is another VGAM1915 host target gene. FGR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGR BINDING SITE, designated SEQ ID:11757, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63207] Another function of VGAM1915 is therefore inhibition of Gardner–Rasheed Feline Sarcoma Viral (v-fgr) Oncogene Homolog (FGR, Accession NM\_005248), a gene which Member of the tyrosine kinase family. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGR. The function of FGR has been established by previous studies. The cell-derived domain of Gardner–Rasheed feline sarcoma virus consists of a gamma-actin sequence and a tyrosine-specific protein kinase sequence

called v-fgr. By means of a v-fgr probe, Tronick et al. (1985) isolated a human homolog. Analysis showed that the human DNA is distinct from all other retroviral oncogenes. They localized the FGR oncogene to 1p36.2-p36.1 by in situ hybridization. By Southern analysis of somatic cell hybrids, Nishizawa et al. (1986) confirmed the assignment of the FGR locus to chromosome 1. FGR, which is the presently used designation, is the same as the oncogene earlier called SRC2. The latter was mapped to 1p36-p34 by Le Beau et al. (1984) using in situ hybridization and by Lebo et al. (1984) using dual-beam chromosome sorting and spot blot DNA analysis. Dracopoli et al. (1988) assigned SRC2 to 1p by analysis of DNA from a panel of somatic cell hybrids and by linkage analysis in the CEPH families. The latter studies showed that the SRC2 locus is 3.1 cM from the Rh blood group locus. They favored the gene order:

1pter--PND--ALPL--FUCA1--SRC2(FGR)--Rh--D1S57--MYCL.

[63208] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63209] Dracopoli, N. C.; Stanger, B. Z.; Lager, M.; Housman, D. E.

: Localization of the FGR protooncogene on the genetic linkage map of human chromosome 1p. Genomics 3: 124–128, 1988. ; and

[63210] Nishizawa, M.; Semba, K.; Yoshida, M. C.; Yamamoto, T.; Sasaki, M.; Toyoshima, K. : Structure, expression, and chromosomal location of the human c-fgr gene. Molec. Cell. Biol. 6: 511–517.

[63211] Further studies establishing the function and utilities of FGR are found in John Hopkins OMIM database record ID 164940, and in cited publications numbered 10881–1088 and 10801–10802 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloperoxidase (MPO, Accession NM\_000250) is another VGAM1915 host target gene. MPO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPO BINDING SITE, designated SEQ ID:5787, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63212] Another function of VGAM1915 is therefore inhibition of

Myeloperoxidase (MPO, Accession NM\_000250), a gene which is present in primary granules of neutrophilic granulocytes. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPO. The function of MPO has been established by previous studies. Weil et al. (1988) found that the MPO gene was translocated to chromosome 15 in all cases of acute promyelocytic leukemia (subtype M3), which is consistently associated with the chromosomal translocation  $t(15;17)(q22;q11.2)$ . In 2 of 4 cases examined by genomic blot analysis, rearrangement of the MPO gene was detected in leukemia cells. Weil et al. (1988) also suggested that MPO may be pivotal in the pathogenesis of APL. According to HGM10, the MPO gene is located at a distance from the breakpoint in APL, and the gene itself is probably usually not rearranged in APL. Myeloperoxidase has been detected in activated microglial macrophages and within amyloid plaques in the central nervous system. Using statistical analysis, Reynolds et al. (2000) examined the relationship between APOE (OMIM Ref. No. 107741) and MPO polymorphisms in the risk of Alzheimer disease (AD; 104300) in a genetically homogeneous Finnish population. They found that the presence of

the MPO A allele in conjunction with APOE E4 significantly increased the risk of AD in men, but not in women (odds ratio for men with both alleles = 11.4 vs APOE E4 alone = 3.0). Reynolds et al. (2000) also found that estrogen receptor- $\alpha$  (OMIM Ref. No. 133430) binds to the MPO A promoter, which may explain the gender differences.

[63213] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63214] Reynolds, W. F.; Hiltunen, M.; Pirskanen, M.; Mannermaa, A.; Helisalmi, S.; Lehtovirta, M.; Alafuzoff, I.; Soininen, H. : MPO and APOE epsilon-4 polymorphisms interact to increase risk for AD in Finnish males. *Neurology* 55: 1284-1290, 2000. ; and

[63215] Weil, S. C.; Rosner, G. L.; Reid, M. S.; Chisholm, R. L.; Lemons, R. S.; Swanson, M. S.; Carrino, J. J.; Diaz, M. O.; Le Beau, M. M. : Translocation and rearrangement of myeloperoxidase.

[63216] Further studies establishing the function and utilities of MPO are found in John Hopkins OMIM database record ID 606989, and in cited publications numbered 5531-5541, 5569, 6146-615 and 9098-6160 listed in the bibliography section hereinbelow, which are also hereby incorpo-

rated by reference. Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458) is another VGAM1915 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17750, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63217] Another function of VGAM1915 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM379. Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM\_006165) is another VGAM1915 host target gene. NFRKB BINDING SITE is HOST

TARGET binding site found in the 5' untranslated region of mRNA encoded by NFRKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFRKB BINDING SITE, designated SEQ ID:12821, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63218] Another function of VGAM1915 is therefore inhibition of Nuclear Factor Related to Kappa B Binding Protein (NFRKB, Accession NM\_006165). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFRKB. 2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM\_016817) is another VGAM1915 host target gene. OAS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAS2 BINDING SITE, designated SEQ ID:18805, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63219] Another function of VGAM1915 is therefore inhibition of 2'-5'-oligoadenylate Synthetase 2, 69/71kDa (OAS2, Accession NM\_016817), a gene which may play a role in mediating resistance to virus infection, control of cell growth, differentiation, and apoptosis. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAS2. The function of OAS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1498. Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM\_002800) is another VGAM1915 host target gene. PSMB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMB9 BINDING SITE, designated SEQ ID:8675, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63220] Another function of VGAM1915 is therefore inhibition of

Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM\_002800), a gene which is one component of a multicatalytic proteinase complex. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB9. The function of PSMB9 has been established by previous studies. Driscoll et al. (1993) showed that the MHC-linked LMP2 and LMP7 subunits function to amplify specific endopeptidase activities of the proteasome. Gaczynska et al. (1993) presented experiments suggesting that gamma-interferon and expression of the LMP2 and LMP7 genes should favor the production by proteasomes of the types of peptides found on MHC class I molecules, which terminate almost exclusively with hydrophobic or basic residues. Animal model experiments lend further support to the function of PSMB9. Van Kaer et al. (1994) generated healthy mice with disrupted *Lmp2* genes. Proteasomal peptidase activity against hydrophobic and basic substrates but not acidic substrates was lower in spleen and liver from mutant mice compared with wildtype mice. Differences in muscle and brain were not significant. Although flow cytometric analysis showed no difference in

MHC class I expression, antigen-presenting cells from mutant mice were less able to stimulate a T-cell hybridoma specific for a nucleoprotein (NP) envelope antigen of an influenza A virus. Mutant mice also had less than half of the wildtype levels of CD8 (see OMIM Ref. No. 186910)-positive T lymphocytes and generated much lower levels of cytotoxic T-cell precursors specific for NP, though not for ovalbumin. Van Kaer et al. (1994) concluded that LMP2 selectively influences antigen processing of MHC class I-restricted antigens.

[63221] It is appreciated that the abovementioned animal model for PSMB9 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[63222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63223] Van Kaer, L.; Ashton-Rickardt, P. G.; Eichelberger, M.; Gaczynska, M.; Nagashima, K.; Rock, K. L.; Goldberg, A. L.; Doherty, P. C.; Tonegawa, S. : Altered peptidase and viral-specific T cell response in LMP2 mutant mice. *Immunity* 1: 533-541, 1994. ; and

[63224] Driscoll, J.; Brown, M. G.; Finley, D.; Monaco, J. J. : MHC-

linked LMP gene products specifically alter peptidase activities of the proteasome. Nature 365: 262–264, 1993.

[63225] Further studies establishing the function and utilities of PSMB9 are found in John Hopkins OMIM database record ID 177045, and in cited publications numbered 1172–1175, 420 and 9736–9740 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_030671) is another VGAM1915 host target gene. PTPRO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPRO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE, designated SEQ ID:25032, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63226] Another function of VGAM1915 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_030671), a gene which may function as a cell contact receptor that mediates and controls cell–cell signals. Accordingly, utilities of VGAM1915 include diag–

nosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. Reticulon 1 (RTN1, Accession NM\_021136) is another VGAM1915 host target gene. RTN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RTN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTN1 BINDING SITE, designated SEQ ID:22108, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63227] Another function of VGAM1915 is therefore inhibition of Reticulon 1 (RTN1, Accession NM\_021136), a gene which may be involved in neuroendocrine secretion or in membrane – membrane trafficking in neuroendocrine cells. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN1. The function of RTN1 and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM337. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is another VGAM1915 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7494, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63228] Another function of VGAM1915 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316) is another VGAM1915 host target gene. TTC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTC3, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC3 BINDING SITE, designated SEQ ID:9318, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63229] Another function of VGAM1915 is therefore inhibition of Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316), a gene which contains tetratricopeptide repeat (TPR) motifs. Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC3. The function of TTC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM699.Zic Family Member 3 Heterotaxy 1 (odd-paired homolog, Drosophila) (ZIC3, Accession NM\_003413) is another VGAM1915 host target gene. ZIC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZIC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIC3 BINDING SITE, desig-

nated SEQ ID:9450, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63230] Another function of VGAM1915 is therefore inhibition of Zic Family Member 3 Heterotaxy 1 (odd-paired homolog, *Drosophila*) (ZIC3, Accession NM\_003413). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIC3. Chromosome 1 Open Reading Frame 19 (C1orf19, Accession XM\_042962) is another VGAM1915 host target gene. C1orf19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf19 BINDING SITE, designated SEQ ID:33840, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63231] Another function of VGAM1915 is therefore inhibition of Chromosome 1 Open Reading Frame 19 (C1orf19, Accession XM\_042962). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C1orf19. DKFZP564I0422 (Accession NM\_031435) is another VGAM1915 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25432, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63232] Another function of VGAM1915 is therefore inhibition of DKFZP564I0422 (Accession NM\_031435). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. FACTP140 (Accession NM\_007192) is another VGAM1915 host target gene. FACTP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACTP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FACTP140 BINDING SITE, designated SEQ ID:14047, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63233] Another function of VGAM1915 is therefore inhibition of FACTP140 (Accession NM\_007192). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACTP140. FLJ12644 (Accession NM\_023074) is another VGAM1915 host target gene. FLJ12644 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12644, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12644 BINDING SITE, designated SEQ ID:23330, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63234] Another function of VGAM1915 is therefore inhibition of FLJ12644 (Accession NM\_023074). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12644. FLJ12806 (Accession NM\_022831) is another VGAM1915 host target gene. FLJ12806 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:23109, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63235] Another function of VGAM1915 is therefore inhibition of FLJ12806 (Accession NM\_022831). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806. FLJ22329 (Accession NM\_024656) is another VGAM1915 host target gene. FLJ22329 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22329, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22329 BINDING SITE, designated SEQ ID:23960, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63236] Another function of VGAM1915 is therefore inhibition of

FLJ22329 (Accession NM\_024656). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22329. FLJ23045 (Accession NM\_024704) is another VGAM1915 host target gene. FLJ23045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23045 BINDING SITE, designated SEQ ID:24021, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63237] Another function of VGAM1915 is therefore inhibition of FLJ23045 (Accession NM\_024704). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23045. Glia Maturation Factor, Beta (GMFB, Accession NM\_004124) is another VGAM1915 host target gene. GMFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GMFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of GMFB BINDING SITE, designated SEQ ID:10329, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63238] Another function of VGAM1915 is therefore inhibition of Glia Maturation Factor, Beta (GMFB, Accession NM\_004124). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMFB. GOLGIN-67 (Accession XM\_170772) is another VGAM1915 host target gene. GOLGIN-67 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGIN-67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGIN-67 BINDING SITE, designated SEQ ID:45538, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63239] Another function of VGAM1915 is therefore inhibition of GOLGIN-67 (Accession XM\_170772). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

GOLGIN-67. KIAA0766 (Accession NM\_014805) is another VGAM1915 host target gene. KIAA0766 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0766 BINDING SITE, designated SEQ ID:16741, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63240] Another function of VGAM1915 is therefore inhibition of KIAA0766 (Accession NM\_014805). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0766. KIAA0855 (Accession NM\_015003) is another VGAM1915 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17379, to the nucleotide sequence of VGAM1915 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4626.

[63241] Another function of VGAM1915 is therefore inhibition of KIAA0855 (Accession NM\_015003). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA0993 (Accession XM\_034413) is another VGAM1915 host target gene. KIAA0993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32076, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63242] Another function of VGAM1915 is therefore inhibition of KIAA0993 (Accession XM\_034413). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1323 (Accession XM\_032146) is another VGAM1915 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31574, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63243] Another function of VGAM1915 is therefore inhibition of KIAA1323 (Accession XM\_032146). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. Peroxisomal Biogenesis Factor 11B (PEX11B, Accession NM\_003846) is another VGAM1915 host target gene. PEX11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX11B BINDING SITE, designated SEQ ID:9943, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63244] Another function of VGAM1915 is therefore inhibition of Peroxisomal Biogenesis Factor 11B (PEX11B, Accession

NM\_003846). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX11B. PRO1992 (Accession NM\_014107) is another VGAM1915 host target gene. PRO1992 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1992 BINDING SITE, designated SEQ ID:15336, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63245] Another function of VGAM1915 is therefore inhibition of PRO1992 (Accession NM\_014107). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1992. RABEX5 (Accession NM\_014504) is another VGAM1915 host target gene. RABEX5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RABEX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of RABEX5 BINDING SITE, designated SEQ ID:15841, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63246] Another function of VGAM1915 is therefore inhibition of RABEX5 (Accession NM\_014504). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABEX5. Retinoblastoma Binding Protein 4 (RBBP4, Accession NM\_005610) is another VGAM1915 host target gene. RBBP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBBP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP4 BINDING SITE, designated SEQ ID:12131, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63247] Another function of VGAM1915 is therefore inhibition of Retinoblastoma Binding Protein 4 (RBBP4, Accession NM\_005610). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with RBBP4. Ring Finger Protein 24 (RNF24, Accession NM\_007219) is another VGAM1915 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14085, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63248] Another function of VGAM1915 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM\_007219). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM\_133489) is another VGAM1915 host target gene. SLC26A10 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC26A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SLC26A10 BINDING SITE, designated SEQ ID:28558, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63249] Another function of VGAM1915 is therefore inhibition of Solute Carrier Family 26, Member 10 (SLC26A10, Accession NM\_133489). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A10.

Thioesterase, Adipose Associated (THEA, Accession XM\_038922) is another VGAM1915 host target gene.

THEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THEA BINDING SITE, designated SEQ ID:32946, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63250] Another function of VGAM1915 is therefore inhibition of Thioesterase, Adipose Associated (THEA, Accession XM\_038922). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THEA. UPLC1 (Accession

NM\_017707) is another VGAM1915 host target gene.

UPLC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by UPLC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPLC1 BINDING SITE, designated SEQ ID:19286, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63251] Another function of VGAM1915 is therefore inhibition of UPLC1 (Accession NM\_017707). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPLC1. LOC145988 (Accession XM\_085290) is another VGAM1915 host target gene. LOC145988 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145988 BINDING SITE, designated SEQ ID:38044, to the nucleotide sequence of VGAM1915 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4626.

[63252] Another function of VGAM1915 is therefore inhibition of LOC145988 (Accession XM\_085290). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145988. LOC146880 (Accession XM\_085627) is another VGAM1915 host target gene. LOC146880 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146880 BINDING SITE, designated SEQ ID:38257, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63253] Another function of VGAM1915 is therefore inhibition of LOC146880 (Accession XM\_085627). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146880. LOC150519 (Accession XM\_086937) is another VGAM1915 host target gene. LOC150519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150519, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150519 BINDING SITE, designated SEQ ID:38988, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63254] Another function of VGAM1915 is therefore inhibition of LOC150519 (Accession XM\_086937). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150519. LOC152373 (Accession XM\_087449) is another VGAM1915 host target gene. LOC152373 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152373 BINDING SITE, designated SEQ ID:39269, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63255] Another function of VGAM1915 is therefore inhibition of LOC152373 (Accession XM\_087449). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152373. LOC158969 (Accession XM\_088728) is another VGAM1915 host target gene. LOC158969 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158969 BINDING SITE, designated SEQ ID:39917, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63256] Another function of VGAM1915 is therefore inhibition of LOC158969 (Accession XM\_088728). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158969. LOC220980 (Accession XM\_167629) is another VGAM1915 host target gene. LOC220980 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC220980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220980 BINDING SITE, designated SEQ ID:44742, to

the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63257] Another function of VGAM1915 is therefore inhibition of LOC220980 (Accession XM\_167629). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220980. LOC222999 (Accession XM\_170185) is another VGAM1915 host target gene. LOC222999 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222999, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222999 BINDING SITE, designated SEQ ID:45312, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63258] Another function of VGAM1915 is therefore inhibition of LOC222999 (Accession XM\_170185). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222999. LOC51267 (Accession NM\_016511) is another VGAM1915 host target gene. LOC51267 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC51267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51267 BINDING SITE, designated SEQ ID:18592, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63259] Another function of VGAM1915 is therefore inhibition of LOC51267 (Accession NM\_016511). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51267. LOC90268 (Accession XM\_030424) is another VGAM1915 host target gene. LOC90268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90268 BINDING SITE, designated SEQ ID:31044, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63260] Another function of VGAM1915 is therefore inhibition of LOC90268 (Accession XM\_030424). Accordingly, utilities

of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90268. LOC91145 (Accession XM\_036454) is another VGAM1915 host target gene. LOC91145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91145 BINDING SITE, designated SEQ ID:32449, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63261] Another function of VGAM1915 is therefore inhibition of LOC91145 (Accession XM\_036454). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91145. LOC91963 (Accession XM\_041902) is another VGAM1915 host target gene. LOC91963 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91963 BINDING SITE, designated SEQ ID:33627, to the nucleotide sequence of VGAM1915 RNA, herein designated VGAM RNA, also designated SEQ ID:4626.

[63262] Another function of VGAM1915 is therefore inhibition of LOC91963 (Accession XM\_041902). Accordingly, utilities of VGAM1915 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91963. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1916 (VGAM1916) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63263] VGAM1916 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1916 was detected is described hereinabove with reference to Figs. 1–8.

[63264] VGAM1916 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 1 Strain Washington/1964. VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63265] VGAM1916 gene encodes a VGAM1916 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1916 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1916 precursor RNA is designated SEQ ID:1902, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1902 is located at position 4687 relative to the genome of Human Parainfluenza Virus 1 Strain Washington/1964.

[63266] VGAM1916 precursor RNA folds onto itself, forming VGAM1916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1916 folded precursor RNA into VGAM1916 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1916 RNA is designated SEQ ID:4627, and is provided hereinbelow with reference to the sequence listing part.

[63268] VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1916 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63269] VGAM1916 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1916 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1916 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63270] The complementary binding of VGAM1916 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1916 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1916 host target RNA into VGAM1916 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63271] It is appreciated that VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1916 host target genes. The mRNA of each one of this plurality of VGAM1916 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1916 RNA, herein designated VGAM RNA, and which when bound by VGAM1916 RNA causes inhibition of translation of respective one or more VGAM1916 host target proteins.

[63272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1916 gene, herein designated VGAM GENE, on one or more VGAM1916 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63273] It is yet further appreciated that a function of VGAM1916 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 1 Strain Washington/1964. Specific functions, and accordingly utilities, of VGAM1916 correlate with, and may be deduced from, the identity of the host target genes which VGAM1916 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63274] Nucleotide sequences of the VGAM1916 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1916 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1916 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1916 are further described hereinbelow with reference to Table 1.

[63275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1916 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1916 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63276] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1916 gene, herein designated VGAM is inhibition of expression of VGAM1916 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1916 correlate with, and may be deduced from, the identity of the target genes which VGAM1916 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63277] AAT1 (Accession XM\_087415) is a VGAM1916 host target gene. AAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AAT1 BINDING SITE, designated SEQ ID:39227, to the nucleotide sequence of VGAM1916 RNA, herein designated VGAM RNA, also designated SEQ ID:4627.

[63278] A function of VGAM1916 is therefore inhibition of AAT1

(Accession XM\_087415), a gene which linkage between A1BG and Lutheran blood group . Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAT1. The function of AAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM357. Angiotensin Like 1 (AMOTL1, Accession XM\_057045) is another VGAM1916 host target gene. AMOTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL1 BINDING SITE, designated SEQ ID:36462, to the nucleotide sequence of VGAM1916 RNA, herein designated VGAM RNA, also designated SEQ ID:4627.

[63279] Another function of VGAM1916 is therefore inhibition of Angiotensin Like 1 (AMOTL1, Accession XM\_057045). Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL1. DKFZP564C196 (Accession

XM\_046405) is another VGAM1916 host target gene. DKFZP564C196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564C196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564C196 BINDING SITE, designated SEQ ID:34711, to the nucleotide sequence of VGAM1916 RNA, herein designated VGAM RNA, also designated SEQ ID:4627.

[63280] Another function of VGAM1916 is therefore inhibition of DKFZP564C196 (Accession XM\_046405). Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C196. EST-YD1 (Accession NM\_021208) is another VGAM1916 host target gene. EST-YD1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EST-YD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EST-YD1 BINDING SITE, designated SEQ ID:22186, to the nucleotide sequence of VGAM1916 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4627.

[63281] Another function of VGAM1916 is therefore inhibition of EST-YD1 (Accession NM\_021208). Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EST-YD1. MGC4832 (Accession NM\_145061) is another VGAM1916 host target gene. MGC4832 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC4832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4832 BINDING SITE, designated SEQ ID:29699, to the nucleotide sequence of VGAM1916 RNA, herein designated VGAM RNA, also designated SEQ ID:4627.

[63282] Another function of VGAM1916 is therefore inhibition of MGC4832 (Accession NM\_145061). Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4832. SH3-domain Kinase Binding Protein 1 (SH3KBP1, Accession XM\_039010) is another VGAM1916 host target gene. SH3KBP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA

encoded by SH3KBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3KBP1 BINDING SITE, designated SEQ ID:32981, to the nucleotide sequence of VGAM1916 RNA, herein designated VGAM RNA, also designated SEQ ID:4627.

[63283] Another function of VGAM1916 is therefore inhibition of SH3-domain Kinase Binding Protein 1 (SH3KBP1, Accession XM\_039010). Accordingly, utilities of VGAM1916 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3KBP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1917 (VGAM1917) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63284] VGAM1917 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1917 was detected is described hereinabove with reference to Figs. 1-8.

[63285] VGAM1917 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Human Parainfluenza Virus 1 Strain Washington/1964. VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63286] VGAM1917 gene encodes a VGAM1917 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1917 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1917 precursor RNA is designated SEQ ID:1903, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1903 is located at position 14949 relative to the genome of Human Parainfluenza Virus 1 Strain Washington/1964.

[63287] VGAM1917 precursor RNA folds onto itself, forming VGAM1917 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[63288] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1917 folded precursor RNA into VGAM1917 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1917 RNA is designated SEQ ID:4628, and is provided hereinbelow with reference to the sequence listing part.

[63289] VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1917 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63290] VGAM1917 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1917 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1917 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1917 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[63291] The complementary binding of VGAM1917 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1917 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1917 host target RNA into VGAM1917 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63292] It is appreciated that VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1917 host target genes. The mRNA of each one of this plurality of VGAM1917 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1917 RNA, herein designated VGAM RNA, and which when bound by VGAM1917 RNA causes inhibition of translation of respective one or more VGAM1917 host target proteins.

[63293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1917 gene, herein designated VGAM GENE, on one or more VGAM1917 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63294] It is yet further appreciated that a function of VGAM1917 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 1 Strain Washington/1964. Specific functions, and accordingly utilities, of VGAM1917 correlate with, and may be deduced from, the identity of the host target genes which VGAM1917 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63295] Nucleotide sequences of the VGAM1917 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1917 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1917 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1917 are further described hereinbelow with reference to Table 1.

[63296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1917 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1917 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63297] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1917 gene, herein designated VGAM is inhibition of expression of VGAM1917 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1917 correlate with, and may be deduced from, the identity of the target genes which VGAM1917 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63298] Adrenergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025) is a VGAM1917 host target gene. ADRB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of ADRB3 BINDING SITE, designated SEQ ID:5458, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63299] A function of VGAM1917 is therefore inhibition of Adren-  
ergic, Beta-3-, Receptor (ADRB3, Accession NM\_000025),  
a gene which stimulates adenylyl cyclase activity and reg-  
ulates lipolysis. Accordingly, utilities of VGAM1917 in-  
clude diagnosis, prevention and treatment of diseases and  
clinical conditions associated with ADRB3. The function of  
ADRB3 and its association with various diseases and clini-  
cal conditions, has been established by previous studies,  
as described hereinabove with reference to  
VGAM179.Fukuyama Type Congenital Muscular Dystrophy  
(fukutin) (FCMD, Accession NM\_006731) is another  
VGAM1917 host target gene. FCMD BINDING SITE is HOST  
TARGET binding site found in the 3' untranslated region  
of mRNA encoded by FCMD, corresponding to a HOST  
TARGET binding site such as BINDING SITE I, BINDING SITE  
II or BINDING SITE III. Table 2 illustrates the complemen-  
tarity of the nucleotide sequences of FCMD BINDING SITE,  
designated SEQ ID:13570, to the nucleotide sequence of  
VGAM1917 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4628.

[63300] Another function of VGAM1917 is therefore inhibition of Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCMD. Kallikrein 3, (prostate specific antigen) (KLK3, Accession NM\_001648) is another VGAM1917 host target gene. KLK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLK3 BINDING SITE, designated SEQ ID:7350, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63301] Another function of VGAM1917 is therefore inhibition of Kallikrein 3, (prostate specific antigen) (KLK3, Accession NM\_001648), a gene which functions in the liquefaction of seminal coagulum. Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLK3. The function of KLK3 has been established by previous studies. Human

prostate-specific antigen (APS) is a kallikrein-like protease present in seminal plasma. It is a single-chain glycoprotein with a molecular mass of about 33 kD which may function normally in the liquefaction of seminal coagulum. Radioimmunoassay of serum levels of this antigen (called PSA in the clinical setting) is useful in the diagnosis and monitoring of prostatic carcinoma (Stamey et al., 1987; Oesterling et al., 1988). (Because PSA is the symbol for the protein S alpha gene (OMIM Ref. No. 176880), APS is used as the gene symbol.) Lundwall and Lilja (1987) cloned a cDNA corresponding to APS, and Schulz et al. (1988) reported the complete sequence of a cDNA encompassing the immature human prostate-specific antigen and an unspliced leader sequence Bansal et al. (2000) investigated the interrelationships of age, PSA, and various zonal measurements in the prostate, and assessed the impact of heritable influences on total PSA. Eighty-four monozygotic twin pairs and 83 dizygotic twin pairs were studied, and serum total PSA, free PSA, and PSA-alpha-1-antichymotrypsin were measured. Their prostate volumes (total (TV), transition zone (TZ), and peripheral zone) were quantitated using transrectal ultrasound. Total PSA was significantly correlated with all zonal

prostate measurements (TZ, peripheral zone, TV, and TZ/TV) and with age. When linear regression was applied, only age and TZ were retained in the final model. The proportion of variability in total PSA explained by these 2 factors, however, was below 24%. In contrast, estimates of heritability showed that approximately 45% of the variability in total PSA could be explained by inherited factors.

[63302] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63303] Bansal, A.; Murray, D. K.; Wu, J. T.; Stephenson, R. A.; Middleton, R. G.; Meikle, A. W. : Heritability of prostate-specific antigen and relationship with zonal prostate volumes in aging twins. J. Clin. Endocr. Metab. 85: 1272–1276, 2000. ; and

[63304] Sutherland, G. R.; Baker, E.; Hyland, V. J.; Callen, D. F.; Close, J. A.; Tregear, G. W.; Evans, B. A.; Richards, R. I. : Human prostate-specific antigen (APS) is a member of the gland.

[63305] Further studies establishing the function and utilities of KLK3 are found in John Hopkins OMIM database record ID 176820, and in cited publications numbered 1639–1640, 11095–11098, 10080–10081, 508 and 4159 listed in the

bibliography section hereinbelow, which are also hereby incorporated by reference. LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM\_005578) is another VGAM1917 host target gene. LPP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPP BINDING SITE, designated SEQ ID:12105, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63306] Another function of VGAM1917 is therefore inhibition of LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM\_005578). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPP. RAB11A, Member RAS Oncogene Family (RAB11A, Accession NM\_004663) is another VGAM1917 host target gene. RAB11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RAB11A BINDING SITE, designated SEQ ID:11035, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63307] Another function of VGAM1917 is therefore inhibition of RAB11A, Member RAS Oncogene Family (RAB11A, Accession NM\_004663). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB11A. HCC-4 (Accession NM\_138611) is another VGAM1917 host target gene. HCC-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCC-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCC-4 BINDING SITE, designated SEQ ID:28899, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63308] Another function of VGAM1917 is therefore inhibition of HCC-4 (Accession NM\_138611). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with HCC-4. IBTK (Accession XM\_041401) is another VGAM1917 host target gene. IBTK BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IBTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IBTK BINDING SITE, designated SEQ ID:33517, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63309] Another function of VGAM1917 is therefore inhibition of IBTK (Accession XM\_041401). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IBTK. KIAA1641 (Accession XM\_087167) is another VGAM1917 host target gene. KIAA1641 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1641 BINDING SITE, designated SEQ ID:39099, to the nucleotide sequence of

VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63310] Another function of VGAM1917 is therefore inhibition of KIAA1641 (Accession XM\_087167). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1641. LOC220846 (Accession XM\_165515) is another VGAM1917 host target gene. LOC220846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220846 BINDING SITE, designated SEQ ID:43660, to the nucleotide sequence of VGAM1917 RNA, herein designated VGAM RNA, also designated SEQ ID:4628.

[63311] Another function of VGAM1917 is therefore inhibition of LOC220846 (Accession XM\_165515). Accordingly, utilities of VGAM1917 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220846. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1918 (VGAM1918) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63312] VGAM1918 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1918 was detected is described hereinabove with reference to Figs. 1–8.

[63313] VGAM1918 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Parainfluenza Virus 1 Strain Washington/1964. VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63314] VGAM1918 gene encodes a VGAM1918 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1918 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1918 precursor RNA is designated SEQ ID:1904, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1904 is located at position 7051 relative to the genome of Human Parainfluenza Virus 1 Strain Washing–

ton/1964.

- [63315] VGAM1918 precursor RNA folds onto itself, forming VGAM1918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [63316] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1918 folded precursor RNA into VGAM1918 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1918 RNA is designated SEQ ID:4629, and is provided hereinbelow with reference to the sequence listing part.
- [63317] VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1918 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63318] VGAM1918 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1918 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1918 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63319] The complementary binding of VGAM1918 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1918 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1918 host target RNA into VGAM1918 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63320] It is appreciated that VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1918 host target genes. The mRNA of each one of this plurality of VGAM1918 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1918 RNA, herein designated VGAM RNA, and which when bound by VGAM1918 RNA causes inhibition of translation of respective one or more VGAM1918 host target proteins.

[63321] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1918 gene, herein designated VGAM GENE, on one or more VGAM1918 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63322] It is yet further appreciated that a function of VGAM1918 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1918 include diagnosis, prevention and treatment of viral infection by Human Parainfluenza Virus 1 Strain Washington/1964. Specific functions, and accord-

ingly utilities, of VGAM1918 correlate with, and may be deduced from, the identity of the host target genes which VGAM1918 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63323] Nucleotide sequences of the VGAM1918 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1918 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1918 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1918 are further described hereinbelow with reference to Table 1.

[63324] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1918 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1918 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63325] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1918 gene, herein designated VGAM is inhibition of expression of VGAM1918 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1918 correlate with, and may be deduced

from, the identity of the target genes which VGAM1918 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63326] KIAA1036 (Accession NM\_014909) is a VGAM1918 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17124, to the nucleotide sequence of VGAM1918 RNA, herein designated VGAM RNA, also designated SEQ ID:4629.

[63327] A function of VGAM1918 is therefore inhibition of KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM1918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. LOC146713 (Accession XM\_097071) is another VGAM1918 host target gene. LOC146713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC146713 BINDING SITE, designated SEQ ID:40716, to the nucleotide sequence of VGAM1918 RNA, herein designated VGAM RNA, also designated SEQ ID:4629.

[63328] Another function of VGAM1918 is therefore inhibition of LOC146713 (Accession XM\_097071). Accordingly, utilities of VGAM1918 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146713. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1919 (VGAM1919) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63329] VGAM1919 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1919 was detected is described hereinabove with reference to Figs. 1–8.

[63330] VGAM1919 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[63331] VGAM1919 gene encodes a VGAM1919 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1919 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1919 precursor RNA is designated SEQ ID:1905, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1905 is located at position 109925 relative to the genome of Equine Herpesvirus 1.

[63332] VGAM1919 precursor RNA folds onto itself, forming VGAM1919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63333] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1919 folded precursor RNA into VGAM1919 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1919 RNA is designated SEQ ID:4630, and is provided hereinbelow with reference to the sequence listing part.

[63334] VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1919 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63335] VGAM1919 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1919 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1919 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63336] The complementary binding of VGAM1919 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1919 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1919 host target RNA into VGAM1919 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63337] It is appreciated that VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1919 host target genes. The mRNA of each one of this plurality of VGAM1919 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1919 RNA, herein designated VGAM RNA, and which when bound by VGAM1919 RNA causes inhibition of translation of respective one or more VGAM1919 host target proteins.

[63338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1919 gene, herein designated VGAM GENE, on one or more VGAM1919 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63339] It is yet further appreciated that a function of VGAM1919 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM1919 correlate with, and may be deduced from, the identity of the host target genes which VGAM1919 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63340] Nucleotide sequences of the VGAM1919 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1919 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1919 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1919 are further described hereinbelow with reference to Table 1.

[63341] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1919 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1919 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63342] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1919 gene, herein designated VGAM is inhibition of expression of VGAM1919 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1919 correlate with, and may be deduced from, the identity of the target genes which VGAM1919 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63343] Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM\_005629) is a VGAM1919 host target gene. SLC6A8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A8 BINDING SITE, designated SEQ ID:12147, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM

RNA, also designated SEQ ID:4630.

[63344] A function of VGAM1919 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, creatine), Member 8 (SLC6A8, Accession NM\_005629). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A8. Telomeric Repeat Binding Factor (NIMA-interacting) 1 (TERF1, Accession NM\_017489) is another VGAM1919 host target gene. TERF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TERF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TERF1 BINDING SITE, designated SEQ ID:18953, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63345] Another function of VGAM1919 is therefore inhibition of Telomeric Repeat Binding Factor (NIMA-interacting) 1 (TERF1, Accession NM\_017489), a gene which negatively regulates telomere length, involves in regulation of the mitotic spindle. Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with TERF1. The function of TERF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM189.Microtubule-actin Crosslinking Factor 1

(MACF1, Accession NM\_012090) is another VGAM1919 host target gene. MACF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MACF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MACF1 BINDING SITE, designated SEQ ID:14376, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63346] Another function of VGAM1919 is therefore inhibition of Microtubule-actin Crosslinking Factor 1 (MACF1, Accession NM\_012090). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MACF1. Testis-specific Kinase 2 (TESK2, Accession XM\_032399) is another VGAM1919 host target gene. TESK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by TESK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TESK2 BINDING SITE, designated SEQ ID:31652, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63347] Another function of VGAM1919 is therefore inhibition of Testis-specific Kinase 2 (TESK2, Accession XM\_032399). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TESK2. LOC146488 (Accession XM\_047748) is another VGAM1919 host target gene. LOC146488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146488 BINDING SITE, designated SEQ ID:35043, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63348] Another function of VGAM1919 is therefore inhibition of

LOC146488 (Accession XM\_047748). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146488. LOC152620 (Accession XM\_011108) is another VGAM1919 host target gene. LOC152620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152620 BINDING SITE, designated SEQ ID:30175, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63349] Another function of VGAM1919 is therefore inhibition of LOC152620 (Accession XM\_011108). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152620. LOC158668 (Accession XM\_045161) is another VGAM1919 host target gene. LOC158668 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158668, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC158668 BINDING SITE, designated SEQ ID:34378, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63350] Another function of VGAM1919 is therefore inhibition of LOC158668 (Accession XM\_045161). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158668. LOC257000 (Accession XM\_172999) is another VGAM1919 host target gene. LOC257000 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257000 BINDING SITE, designated SEQ ID:46273, to the nucleotide sequence of VGAM1919 RNA, herein designated VGAM RNA, also designated SEQ ID:4630.

[63351] Another function of VGAM1919 is therefore inhibition of LOC257000 (Accession XM\_172999). Accordingly, utilities of VGAM1919 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257000. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1920 (VGAM1920) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63352] VGAM1920 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1920 was detected is described hereinabove with reference to Figs. 1–8.

[63353] VGAM1920 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63354] VGAM1920 gene encodes a VGAM1920 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1920 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1920 precursor RNA is designated SEQ ID:1906, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1906 is located at position 12749 relative to the genome of Canine Distemper Virus.

[63355] VGAM1920 precursor RNA folds onto itself, forming VGAM1920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63356] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1920 folded precursor RNA into VGAM1920 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1920 RNA is designated SEQ ID:4631, and is provided hereinbelow with reference to the sequence listing part.

[63357] VGAM1920 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1920 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63358] VGAM1920 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1920 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1920 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1920 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[63359] The complementary binding of VGAM1920 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1920 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1920 host target RNA into VGAM1920 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63360] It is appreciated that VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1920 host target genes. The mRNA of each one of this plurality of VGAM1920 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1920 RNA, herein designated VGAM RNA, and which when bound by VGAM1920 RNA causes inhibition of translation of respective one or more

VGAM1920 host target proteins.

[63361] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1920 gene, herein designated VGAM GENE, on one or more VGAM1920 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63362] It is yet further appreciated that a function of VGAM1920 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus.

Specific functions, and accordingly utilities, of VGAM1920 correlate with, and may be deduced from, the identity of the host target genes which VGAM1920 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63363] Nucleotide sequences of the VGAM1920 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1920 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1920 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1920 are further described hereinbelow with reference to Table 1.

[63364] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1920 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1920 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63365] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1920 gene, herein designated VGAM is inhibition of expression of VGAM1920 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1920 correlate with, and may be deduced from, the identity of the target genes which VGAM1920 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63366] Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM\_052962) is a VGAM1920 host target gene. IL22RA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL22RA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL22RA2 BINDING SITE, designated SEQ ID:27520, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63367] A function of VGAM1920 is therefore inhibition of Interleukin 22 Receptor, Alpha 2 (IL22RA2, Accession NM\_052962), a gene which induces the production of acute-phase reactants. Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL22RA2. The function of IL22RA2 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM167.DKFZp566D133 (Accession XM\_050005) is another VGAM1920 host target gene. DKFZp566D133 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp566D133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566D133 BINDING SITE, designated SEQ ID:35542, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63368] Another function of VGAM1920 is therefore inhibition of DKFZp566D133 (Accession XM\_050005). Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566D133. FLJ11160 (Accession NM\_018344) is another VGAM1920 host target gene. FLJ11160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ11160 BINDING SITE, designated SEQ ID:20350, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63369] Another function of VGAM1920 is therefore inhibition of FLJ11160 (Accession NM\_018344). Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11160. FLJ14936 (Accession NM\_032864) is another VGAM1920 host target gene. FLJ14936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14936 BINDING SITE, designated SEQ ID:26668, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63370] Another function of VGAM1920 is therefore inhibition of FLJ14936 (Accession NM\_032864). Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14936. KIAA1522 (Accession XM\_036299) is another VGAM1920 host target gene. KIAA1522 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32415, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63371] Another function of VGAM1920 is therefore inhibition of KIAA1522 (Accession XM\_036299). Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. Polymerase I and Transcript Release Factor (PTRF, Accession XM\_032852) is another VGAM1920 host target gene. PTRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTRF BINDING SITE, designated SEQ ID:31781, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63372] Another function of VGAM1920 is therefore inhibition of Polymerase I and Transcript Release Factor (PTRF, Accession XM\_032852). Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTRF. LOC253959 (Accession XM\_170749) is another VGAM1920 host target gene. LOC253959 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253959 BINDING SITE, designated SEQ ID:45508, to the nucleotide sequence of VGAM1920 RNA, herein designated VGAM RNA, also designated SEQ ID:4631.

[63373] Another function of VGAM1920 is therefore inhibition of LOC253959 (Accession XM\_170749). Accordingly, utilities of VGAM1920 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253959. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1921 (VGAM1921) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63374] VGAM1921 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1921 was detected is described hereinabove with reference to Figs. 1–8.

[63375] VGAM1921 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63376] VGAM1921 gene encodes a VGAM1921 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1921 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1921 precursor RNA is designated SEQ ID:1907, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1907 is located at position 9746 relative to the genome of Canine Distemper Virus.

[63377] VGAM1921 precursor RNA folds onto itself, forming

VGAM1921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63378] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1921 folded precursor RNA into VGAM1921 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1921 RNA is designated SEQ ID:4632, and is provided hereinbelow with reference to the sequence listing part.

[63379] VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1921 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[63380] VGAM1921 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1921 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1921 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63381] The complementary binding of VGAM1921 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1921 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1921 host target RNA into VGAM1921 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63382] It is appreciated that VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1921 host target genes. The mRNA of each one of this plurality of VGAM1921 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1921 RNA, herein designated VGAM RNA, and which when bound by VGAM1921 RNA causes inhibition of translation of respective one or more VGAM1921 host target proteins.

[63383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1921 gene, herein designated VGAM GENE, on one or more VGAM1921 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63384] It is yet further appreciated that a function of VGAM1921 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus. Specific functions, and accordingly utilities, of VGAM1921 correlate with, and may be deduced from, the identity of the host target genes which VGAM1921 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[63385] Nucleotide sequences of the VGAM1921 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1921 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1921 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1921 are further described hereinbelow with reference to Table 1.

[63386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1921 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1921 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1921 gene, herein designated VGAM is inhibition of expression of VGAM1921 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1921 correlate with, and may be deduced from, the identity of the target genes which VGAM1921 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[63388] Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821) is a VGAM1921 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28080, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63389] A function of VGAM1921 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. FLJ10891 (Accession NM\_018260) is another VGAM1921 host target gene. FLJ10891 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ10891 BINDING SITE, designated SEQ ID:20225, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63390] Another function of VGAM1921 is therefore inhibition of FLJ10891 (Accession NM\_018260). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10891. FLJ12985 (Accession NM\_024924) is another VGAM1921 host target gene. FLJ12985 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12985, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12985 BINDING SITE, designated SEQ ID:24463, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63391] Another function of VGAM1921 is therefore inhibition of FLJ12985 (Accession NM\_024924). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12985. FLJ25416 (Accession NM\_145018) is another

VGAM1921 host target gene. FLJ25416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ25416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25416 BINDING SITE, designated SEQ ID:29624, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63392] Another function of VGAM1921 is therefore inhibition of FLJ25416 (Accession NM\_145018). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25416. Potassium Inwardly-rectifying Channel, Subfamily J, Member 2 (KCNJ2, Accession NM\_000891) is another VGAM1921 host target gene. KCNJ2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ2 BINDING SITE, designated SEQ ID:6589, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA,

also designated SEQ ID:4632.

[63393] Another function of VGAM1921 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 2 (KCNJ2, Accession NM\_000891). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ2. KIAA0798 (Accession NM\_014650) is another VGAM1921 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16064, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63394] Another function of VGAM1921 is therefore inhibition of KIAA0798 (Accession NM\_014650). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0798. LOC145813 (Accession XM\_096873) is another VGAM1921 host target gene. LOC145813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC145813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145813 BINDING SITE, designated SEQ ID:40596, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63395] Another function of VGAM1921 is therefore inhibition of LOC145813 (Accession XM\_096873). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145813. LOC255624 (Accession XM\_170531) is another VGAM1921 host target gene. LOC255624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255624 BINDING SITE, designated SEQ ID:45351, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63396] Another function of VGAM1921 is therefore inhibition of LOC255624 (Accession XM\_170531). Accordingly, utilities

of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255624. LOC64116 (Accession NM\_022154) is another VGAM1921 host target gene. LOC64116 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC64116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC64116 BINDING SITE, designated SEQ ID:22712, to the nucleotide sequence of VGAM1921 RNA, herein designated VGAM RNA, also designated SEQ ID:4632.

[63397] Another function of VGAM1921 is therefore inhibition of LOC64116 (Accession NM\_022154). Accordingly, utilities of VGAM1921 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC64116. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1922 (VGAM1922) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63398] VGAM1922 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1922 was detected is described hereinabove with reference to Figs. 1–8.

[63399] VGAM1922 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63400] VGAM1922 gene encodes a VGAM1922 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1922 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1922 precursor RNA is designated SEQ ID:1908, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1908 is located at position 11765 relative to the genome of Canine Distemper Virus.

[63401] VGAM1922 precursor RNA folds onto itself, forming VGAM1922 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63402] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1922 folded precursor RNA into VGAM1922 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1922 RNA is designated SEQ ID:4633, and is provided hereinbelow with reference to the sequence listing part.

[63403] VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1922 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[63404] VGAM1922 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1922 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1922 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63405] The complementary binding of VGAM1922 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1922 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1922 host target RNA into VGAM1922 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63406] It is appreciated that VGAM1922 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1922 host target genes. The mRNA of each one of this plurality of VGAM1922 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1922 RNA, herein designated VGAM RNA, and which when bound by VGAM1922 RNA causes inhibition of translation of respective one or more VGAM1922 host target proteins.

[63407] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1922 gene, herein designated VGAM GENE, on one or more VGAM1922 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[63408] It is yet further appreciated that a function of VGAM1922 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus. Specific functions, and accordingly utilities, of VGAM1922 correlate with, and may be deduced from, the identity of the host target genes which VGAM1922 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63409] Nucleotide sequences of the VGAM1922 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1922 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1922 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1922 are further  
described hereinbelow with reference to Table 1.

[63410] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1922 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1922 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[63411] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1922 gene, herein designated VGAM is  
inhibition of expression of VGAM1922 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1922 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1922  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[63412] Nucleosome Assembly Protein 1-like 4 (NAP1L4, Acces-  
sion NM\_005969) is a VGAM1922 host target gene.

NAP1L4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAP1L4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAP1L4 BINDING SITE, designated SEQ ID:12591, to the nucleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, also designated SEQ ID:4633.

[63413] A function of VGAM1922 is therefore inhibition of Nucleosome Assembly Protein 1-like 4 (NAP1L4, Accession NM\_005969), a gene which may have a role as a histone chaperone. Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L4. The function of NAP1L4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949.NDRG Family Member 2 (NDRG2, Accession NM\_016250) is another VGAM1922 host target gene. NDRG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDRG2 BINDING SITE, designated SEQ ID:18379, to the nucleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, also designated SEQ ID:4633.

[63414] Another function of VGAM1922 is therefore inhibition of NDRG Family Member 2 (NDRG2, Accession NM\_016250), a gene which belongs to the ndrg family. Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG2. The function of NDRG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1130. Plastin 3 (T isoform) (PLS3, Accession NM\_005032) is another VGAM1922 host target gene. PLS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLS3 BINDING SITE, designated SEQ ID:11472, to the nucleotide sequence of VGAM1922 RNA, herein

designated VGAM RNA, also designated SEQ ID:4633.

[63415] Another function of VGAM1922 is therefore inhibition of Plastin 3 (T isoform) (PLS3, Accession NM\_005032), a gene which binds actin. Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLS3. The function of PLS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1754. Rhodopsin (opsin 2, rod pigment) (retinitis pigmentosa 4, autosomal dominant) (RHO, Accession NM\_000539) is another VGAM1922 host target gene. RHO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RHO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHO BINDING SITE, designated SEQ ID:6139, to the nucleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, also designated SEQ ID:4633.

[63416] Another function of VGAM1922 is therefore inhibition of Rhodopsin (opsin 2, rod pigment) (retinitis pigmentosa 4, autosomal dominant) (RHO, Accession NM\_000539). Ac-

cordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHO. CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838) is another VGAM1922 host target gene. CSMD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE, designated SEQ ID:36192, to the nucleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, also designated SEQ ID:4633.

[63417] Another function of VGAM1922 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession XM\_054838). Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. MKP-7 (Accession XM\_039106) is another VGAM1922 host target gene. MKP-7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKP-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of MKP-7 BINDING SITE, designated SEQ ID:33006, to the nucleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, also designated SEQ ID:4633.

[63418] Another function of VGAM1922 is therefore inhibition of MKP-7 (Accession XM\_039106). Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKP-7. Matrix Metalloproteinase 28 (MMP28, Accession NM\_032950) is another VGAM1922 host target gene. MMP28 BINDING SITE1 and MMP28 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP28, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP28 BINDING SITE1 and MMP28 BINDING SITE2, designated SEQ ID:26763 and SEQ ID:23594 respectively, to the nucleotide sequence of VGAM1922 RNA, herein designated VGAM RNA, also designated SEQ ID:4633.

[63419] Another function of VGAM1922 is therefore inhibition of Matrix Metalloproteinase 28 (MMP28, Accession

NM\_032950). Accordingly, utilities of VGAM1922 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP28. BCL2-like 2 (BCL2L2, Accession NM\_004050) is another VGAM1923 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10266, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63420] Another function of VGAM1923 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM\_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM431. Cyclin D2 (CCND2, Accession NM\_001759) is another VGAM1923 host target gene.

CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7519, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63421] Another function of VGAM1923 is therefore inhibition of Cyclin D2 (CCND2, Accession NM\_001759), a gene which is essential for the control of the cell cycle at the G1/s (start) transition. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.CDK2-associated Protein 1 (CDK2AP1, Accession NM\_004642) is another VGAM1923 host target gene. CDK2AP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK2AP1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK2AP1 BINDING SITE, designated SEQ ID:11016, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63422] Another function of VGAM1923 is therefore inhibition of CDK2-associated Protein 1 (CDK2AP1, Accession NM\_004642), a gene which negatively regulates CDK2 activity. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK2AP1. The function of CDK2AP1 has been established by previous studies. Todd et al. (1995) isolated an evolutionarily conserved gene that exhibits frequent losses of heterozygosity (LOH) and significant reduction in expression in malignant oral keratinocytes of the hamster (*Mesocricetus auratus*). They symbolized the gene doc-1 for 'deleted in oral cancer.' Transfection of normal doc-1 cDNA into malignant oral keratinocytes reversed the transformed phenotype in the hamster model. Daigo et al. (1997) isolated a human cDNA encoding a 115-amino acid polypeptide that shows 97% identity to the doc-1 gene of the hamster. It also

shows a high degree of homology to a gene induced by TNF-alpha (OMIM Ref. No. 191160) in the mouse. To investigate its possible role in esophageal carcinogenesis, they examined genetic alterations in expression levels of the gene in 13 esophageal carcinoma cell lines and 10 primary esophageal carcinomas. No mutation or reduction of expression was observed in any of the 23 cancer materials examined. By fluorescence in situ hybridization, they mapped the human DOC1 gene to 12q24.31.

[63423] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63424] Daigo, Y.; Suzuki, K.; Maruyama, O.; Miyoshi, Y.; Yasuda, T.; Kabuto, T.; Imaoka, S.; Fujiwara, T.; Takahashi, E.; Fujino, M. A.; Nakamura, Y. : Isolation, mapping, and mutation analysis of a human cDNA homologous to the doc-1 gene of the Chinese hamster, a candidate tumor suppressor for oral cancer. *Genes Chromosomes Cancer* 20: 204-207, 1997. ; and

[63425] Todd, R.; McBride, J.; Tsuji, T.; Donoff, R. B.; Nagai, M.; Chou, M. Y.; Chiang, T.; Wong, D. T. W. : Deleted in oral cancer-1 (doc-1), a novel oral tumor suppressor gene. *FASEB J.* 1362.

[63426] Further studies establishing the function and utilities of CDK2AP1 are found in John Hopkins OMIM database record ID 602198, and in cited publications numbered 1226–1227 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246) is another VGAM1923 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15517, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63427] Another function of VGAM1923 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The func-

tion of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459. Chromosome Condensation 1-like (CHC1L, Accession NM\_001268) is another VGAM1923 host target gene. CHC1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHC1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHC1L BINDING SITE, designated SEQ ID:6931, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63428] Another function of VGAM1923 is therefore inhibition of Chromosome Condensation 1-like (CHC1L, Accession NM\_001268). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHC1L. C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 11 (CLECSF11, Accession NM\_130441) is another VGAM1923 host target gene. CLECSF11 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by CLECSF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF11 BINDING SITE, designated SEQ ID:28200, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63429] Another function of VGAM1923 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 11 (CLECSF11, Accession NM\_130441), a gene which may play a role in ligand internalization and presentation. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF11. The function of CLECSF11 has been established by previous studies. CLONING By screening an EST database for sequences homologous to the CRD of DC immunoreceptor (DCIR; 605306), followed by 5-prime and 3-prime RACE, Arce et al. (2001) obtained a cDNA encoding DLEC. Sequence analysis predicted that DLEC is a 213-amino acid type II integral membrane protein with an N-terminal cytoplasmic tail, a transmembrane region, an extracellular stalk region, and a single C-terminal CRD.

The CRD is 79% identical to that of DCIR and has 3 potential N-glycosylation sites and 1 conserved calcium-binding site that contains a mannose-binding EPN motif. RT-PCR analysis suggested the existence of a splice variant, DLEC-beta. Northern blot analysis did not detect expression of DLEC in immunologic tissues. RT-PCR analysis detected expression of DLEC only in peripheral blood mononuclear cells and immature dendritic cells. Northern blot analysis showed constitutive expression of DLEC in immature monocyte-derived DCs that was downregulated by maturation with lipopolysaccharide but not with tumor necrosis factor (TNF; 191160). By immunoscreening COS cells expressing cDNAs from plasmacytoid dendritic cells (PDCs), Dzionek et al. (2001) obtained a cDNA encoding DLEC, which they designated BDCA2. RT-PCR analysis detected expression of BDCA2 that was restricted to PDCs. Immunofluorescence microscopy and immunohistochemistry demonstrated expression of BDCA2 in CD123 (IL3RA; 308385)-positive tonsillar and lymph node cells. RT-PCR analysis suggested the existence of 5 BDCA2 splice variants, each lacking 1 or 2 exons. Immunoprecipitation and SDS-PAGE analyses showed expression of a 38-kD BDCA2 protein. Functional analysis indicated that BDCA2 mobi-

lizes intracellular calcium. Immunoblot analysis established that anti-BDCA2 triggers protein-tyrosine phosphorylation of PDCs. ELISA showed that BDCA2 ligation inhibits IFNA (OMIM Ref. No. 147660)/IFNB (OMIM Ref. No. 147640) production by cells stimulated with influenza antigens or anti-DNA antibodies.

[63430] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63431] Arce, I.; Roda-Navarro, P.; Montoya, M. C.; Hernanz-Falcon, P.; Puig-Kroger, A.; Fernandez-Ruiz, E. : Molecular and genomic characterization of human DLEC, a novel member of the C-type lectin receptor gene family preferentially expressed on monocyte-derived dendritic cells. *Europ. J. Immun.* 31: 2733-2740, 2001. ; and

[63432] Dzionek, A.; Sohma, Y.; Nagafune, J.; Cella, M.; Colonna, M.; Facchetti, F.; Gunther, G.; Johnston, I.; Lanzavecchia, A.; Nagasaka, T.; Okada, T.; Vermi, W.; Winkels, G.; Yamamoto, T.;

[63433] Further studies establishing the function and utilities of CLECSF11 are found in John Hopkins OMIM database record ID 606677, and in cited publications numbered 5543-5544 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM\_000104) is another VGAM1923 host target gene. CYP1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1B1 BINDING SITE, designated SEQ ID:5565, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63434] Another function of VGAM1923 is therefore inhibition of Cytochrome P450, Subfamily I (dioxin-inducible), Polypeptide 1 (glaucoma 3, primary infantile) (CYP1B1, Accession NM\_000104), a gene which participates in the metabolism of a molecule that is a participant in eye development. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1B1. The function of CYP1B1 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM894.Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM\_000782) is another VGAM1923 host target gene. CYP24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP24 BINDING SITE, designated SEQ ID:6428, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63435] Another function of VGAM1923 is therefore inhibition of Cytochrome P450, Subfamily XXIV (vitamin D 24-hydroxylase) (CYP24, Accession NM\_000782), a gene which induces the differentiation of promyelocytes into monocytes/macrophages. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP24. The function of CYP24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1204.Dystrophin (muscular dystrophy, Duchenne

and Becker types) (DMD, Accession NM\_000109) is another VGAM1923 host target gene. DMD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE, designated SEQ ID:5572, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63436] Another function of VGAM1923 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_000109), a gene which muscular dystrophy . Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.DNA (cytosine-5-)-methyltransferase 2 (DNMT2, Accession NM\_004412) is another VGAM1923 host target gene. DNMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DNMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT2 BINDING SITE, designated SEQ ID:10672, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63437] Another function of VGAM1923 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 2 (DNMT2, Accession NM\_004412), a gene which may mark specific sequences in the genome . Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT2. The function of DNMT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM177. Diphtheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 2 (*S. cerevisiae*) (DPH2L2, Accession NM\_001384) is another VGAM1923 host target gene. DPH2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPH2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPH2L2 BINDING SITE, designated SEQ ID:7058, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63438] Another function of VGAM1923 is therefore inhibition of Diphtheria Toxin Resistance Protein Required For Diphthamide Biosynthesis-like 2 (*S. cerevisiae*) (DPH2L2, Accession NM\_001384), a gene which is required for diphthamide biosynthesis. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPH2L2. The function of DPH2L2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1221. Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228) is another VGAM1923 host target gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of EGFR BINDING SITE, designated SEQ ID:11726, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63439] Another function of VGAM1923 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950) is another VGAM1923 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ

ID:10084, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63440] Another function of VGAM1923 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM\_022977) is another VGAM1923 host target gene. FACL4 BINDING SITE1 and FACL4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FACL4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE1 and FACL4 BINDING SITE2, designated SEQ ID:23254 and SEQ ID:10764 respectively, to the

nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63441] Another function of VGAM1923 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM\_022977). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4. G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490) is another VGAM1923 host target gene. GPR48 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR48, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:20551, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63442] Another function of VGAM1923 is therefore inhibition of G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490), a gene which binds to follicle-stimulating hormone and thyroid-stimulating hormone. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with GPR48. The function of GPR48 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM376. Histone Deacetylase 7A (HDAC7A, Accession NM\_015401) is another VGAM1923 host target gene. HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HDAC7A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC7A BINDING SITE1 and HDAC7A BINDING SITE2, designated SEQ ID:17713 and SEQ ID:18683 respectively, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63443] Another function of VGAM1923 is therefore inhibition of Histone Deacetylase 7A (HDAC7A, Accession NM\_015401). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC7A. Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM\_001530) is another VGAM1923 host target gene. HIF1A BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by HIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIF1A BINDING SITE, designated SEQ ID:7268, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63444] Another function of VGAM1923 is therefore inhibition of Hypoxia-inducible Factor 1, Alpha Subunit (basic helix-loop-helix transcription factor) (HIF1A, Accession NM\_001530), a gene which is a basic helix-loop-helix transcription factor and mediates transcriptional responses to hypoxia and dioxin-signaling. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIF1A. The function of HIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586) is another VGAM1923 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15952, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63445] Another function of VGAM1923 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Interleukin 8 Receptor, Alpha (IL8RA, Accession NM\_000634) is another VGAM1923 host target gene. IL8RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL8RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL8RA BINDING SITE, designated SEQ ID:6267, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63446] Another function of VGAM1923 is therefore inhibition of

Interleukin 8 Receptor, Alpha (IL8RA, Accession NM\_000634), a gene which is the receptor to interleukin-8, which is a powerful neutrophils chemotactic factor. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL8RA. The function of IL8RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM300. inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM\_005536) is another VGAM1923 host target gene. IMPA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPA1 BINDING SITE, designated SEQ ID:12058, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63447] Another function of VGAM1923 is therefore inhibition of inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM\_005536), a gene which is responsible for the provision of inositol required for synthesis of phos-

phatidylinositol and polyphosphoinositides. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPA1. The function of IMPA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134. Insulinoma-associated 1 (INSM1, Accession NM\_002196) is another VGAM1923 host target gene. INSM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INSM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INSM1 BINDING SITE, designated SEQ ID:7952, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63448] Another function of VGAM1923 is therefore inhibition of Insulinoma-associated 1 (INSM1, Accession NM\_002196). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INSM1. MAD, Mothers Against Decapentaplegic Homolog 7 (Drosophila) (MADH7, Accession

NM\_005904) is another VGAM1923 host target gene.

MADH7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADH7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH7 BINDING SITE, designated SEQ ID:12525, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63449] Another function of VGAM1923 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 7 (Drosophila) (MADH7, Accession NM\_005904), a gene which may affect transcription in response to TGF-beta superfamily signaling pathways, inhibits BMP/Smad1 (MADH1) signaling. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH7. The function of MADH7 has been established by previous studies. Lallemand et al. (2001) showed that cells stably expressing SMAD7 had increased susceptibility to apoptosis induced by TGFB (OMIM Ref. No. 190180), TNFA (OMIM Ref. No. 191160), serum withdrawal, or loss of cell adhesion

(anoikis). SMAD7 decreased NFkB (OMIM Ref. No. 164011) activity, providing a mechanism for the increased apoptosis. Stable expression of RAS (OMIM Ref. No. 190020) suppressed SMAD7 inhibition of NFkB and SMAD7 potentiation of apoptosis. Scleroderma is a chronic systemic disease that leads to fibrosis of the skin and other affected organs. TGFB has been implicated in the pathogenesis of scleroderma. SMAD proteins function as signaling transducers downstream from TGFB receptors. Dong et al. (2002) investigated the signaling components of the TGFB pathway and TGFB activity in scleroderma lesions in vivo and in scleroderma fibroblasts in vitro. Basal level and TGFB-inducible expression of SMAD7 were selectively decreased, whereas SMAD3 (OMIM Ref. No. 603109) expression was increased both in scleroderma skin and in explanted scleroderma fibroblasts in culture. TGFB signaling events were increased in scleroderma fibroblasts relative to normal fibroblasts. In vitro adenoviral gene transfer with SMAD7 restored normal TGFB signaling in scleroderma fibroblasts. These results suggested that alterations in the SMAD pathway, including marked SMAD7 deficiency and SMAD3 upregulation, may be responsible for TGFB hyperresponsiveness observed in scleroderma

- [63450] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [63451] Lallemand, F.; Mazars, A.; Prunier, C.; Bertrand, F.; Kornprost, M.; Gallea, S.; Roman-Roman, S.; Cherqui, G.; Atfi, A. : Smad7 inhibits the survival nuclear factor kappa-B and potentiates apoptosis in epithelial cells. *Oncogene* 20: 879–884, 2001. ; and
- [63452] Dong, C.; Zhu, S.; Wang, T.; Yoon, W.; Li, Z.; Alvarez, R. J.; ten Dijke, P.; White, B.; Wigley, F. M.; Goldschmidt-Clermont, P. J. : Deficient Smad7 expression: a putative molecular defec.
- [63453] Further studies establishing the function and utilities of MADH7 are found in John Hopkins OMIM database record ID 602932, and in cited publications numbered 7970–797 and 7753 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAX Protein (MAX, Accession NM\_002382) is another VGAM1923 host target gene. MAX BINDING SITE1 through MAX BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MAX BINDING SITE1 through MAX BINDING SITE4, designated SEQ ID:8201, SEQ ID:29718, SEQ ID:29720 and SEQ ID:29723 respectively, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63454] Another function of VGAM1923 is therefore inhibition of MAX Protein (MAX, Accession NM\_002382), a gene which interacts specifically with the MYC (190080) protein . Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAX. The function of MAX has been established by previous studies. The MAX gene encodes a protein that interacts specifically with the MYC (OMIM Ref. No. 190080) protein to form a heterodimer with high affinity for the specific cognate DNA binding site of MYC. Wagner et al. (1992) demonstrated that 2 species of RNA hybridized specifically to a MAX cDNA probe in all human and murine cell lines tested. Unlike MYC, the steady state level of MAX RNA was not significantly modulated with respect to proliferation or differentiation. Unlike MYC RNA, MAX RNA was relatively stable with a half-life of more than 3 hours, and therefore it did not exhibit the charac-

teristic short half-life of RNAs encoded by most immediate early genes. The predicted tertiary structure of MAX closely resembles that of MYC, and it was on the basis of the basic/helix-loop-helix/leucine-zipper homology that Prendergast et al. (1991) cloned the cDNA encoding MAX. Zervos et al. (1995) described MIX2 (OMIM Ref. No. 600601), a protein that interacts with the MAX protein. Grandori et al. (1996) identified DDX18 (OMIM Ref. No. 606355) as a direct in vivo target of Myc and Max and hypothesized that Myc may exert its effects on cell behavior through proteins that affect RNA structure and metabolism. By fluorescence in situ chromosomal hybridization, Wagner et al. (1992) demonstrated that the MAX gene is located in band 14q23. This region of chromosome 14 is involved in deletions in B-cell chronic lymphocytic leukemia and malignant lymphomas and in the 12;14 translocation in uterine leiomyomas. Gilladoga et al. (1992) similarly mapped the MAX gene to 14q22-q24 by isotopic in situ hybridization and to mouse chromosome 12 in region D.

[63455] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63456] Wagner, A. J.; Le Beau, M. M.; Diaz, M. O.; Hay, N. : Expression, regulation, and chromosomal localization of the Max gene. Proc. Nat. Acad. Sci. 89: 3111–3115, 1992. ; and

[63457] Prendergast, G. C.; Lawe, D.; Ziff, E. B. : Association of Myn, the murine homolog of Max, with c-Myc stimulates methylation-sensitive DNA binding and Ras cotransformation. Cell 65: 395–.

[63458] Further studies establishing the function and utilities of MAX are found in John Hopkins OMIM database record ID 154950, and in cited publications numbered 2965–2967, 1109 and 11099–11101 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nescient Helix Loop Helix 1 (NHLH1, Accession NM\_005598) is another VGAM1923 host target gene. NHLH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NHLH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NHLH1 BINDING SITE, designated SEQ ID:12126, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ

ID:4634.

[63459] Another function of VGAM1923 is therefore inhibition of Nescient Helix Loop Helix 1 (NHLH1, Accession NM\_005598), a gene which may have a role in development of the nervous system. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NHLH1. The function of NHLH1 has been established by previous studies. Begley et al. (1992) identified a novel member of the HLH family based on its hybridization to SCL. SCL, also called TAL1, had been identified because of its involvement in a 1;14 translocation in a stem cell leukemia; it is disrupted in about one-fourth of cases of T-cell acute lymphoblastic leukemia. The novel gene was referred to as NSCL because of its expression in the developing nervous system. Murine Nscl cDNA clones had a coding region of 399 basepairs, predicting a protein of 14.8 kD. The nucleotide sequence showed 71% identity and the amino acid sequence 61% identity to murine Scl in the HLH domain. Animal model experiments lend further support to the function of NHLH1. Cogliati et al. (2002) developed Nhlh1 null mice. Homozygous mutant mice were predisposed to premature, adult-onset, unexpected death. Elec-

trocardiograms revealed decreased heart rate variability, stress-induced arrhythmia, and impaired baroreceptor sensitivity. Heterozygosity for the closely related transcription factor *Nhlh2* increased the severity of the *Nhlh1* null phenotype. No signs of primary cardiac structural or conduction abnormalities were revealed in the *Nhlh1* null mice. The pattern of altered heart rhythm observed in basal and experimental stress conditions suggested that a deficient parasympathetic tone contributed to the arrhythmia in the *Nhlh1* null mice. Supporting their conclusion, Cogliati et al. (2002) found that *Nhlh1* was expressed in the developing brain stem and vagal nuclei of wildtype mice.

[63460] It is appreciated that the abovementioned animal model for NHLH1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[63461] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63462] Begley, C. G.; Lipkowitz, S.; Gobel, V.; Mahon, K. A.; Bertness, V.; Green, A. R.; Gough, N. M.; Kirsch, I. R. : Molecular characterization of NSCL, a gene encoding a helix-

loop-helix protein expressed in the developing nervous system. Proc. Nat. Acad. Sci. 89: 38-42, 1992. ; and

[63463] Cogliati, T.; Good, D. J.; Haigney, M.; Delgado-Romero, P.; Eckhaus, M. A.; Koch, W. J.; Kirsch, I. R. : Predisposition to arrhythmia and autonomic dysfunction in Nhlh1-deficient mice. M.

[63464] Further studies establishing the function and utilities of NHLH1 are found in John Hopkins OMIM database record ID 162360, and in cited publications numbered 11104-11108 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NHP2 Non-histone Chromosome Protein 2-like 1 (*S. cerevisiae*) (NHP2L1, Accession NM\_005008) is another VGAM1923 host target gene. NHP2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NHP2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NHP2L1 BINDING SITE, designated SEQ ID:11445, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63465] Another function of VGAM1923 is therefore inhibition of

NHP2 Non-histone Chromosome Protein 2-like 1 (*S. cerevisiae*) (NHP2L1, Accession NM\_005008), a gene which may play a role in the late stage of spliceosome assembly. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NHP2L1. The function of NHP2L1 has been established by previous studies. In the course of sequencing cDNA clones from fetal brain cDNA libraries, Saito et al. (1996) isolated a gene that encodes a protein highly homologous to NHP2 from *Saccharomyces cerevisiae* (Kolodrubetz and Burgum, 1991). NHP2 is a high-mobility group (HMG)-like protein which is located in the nucleus, although it shows weak homology to some ribosomal proteins. The cDNA cloned by Saito et al. (1996), symbolized NHP2L1, was expressed in all human tissues examined and was localized to 12q24.3 by fluorescence in situ hybridization.

[63466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63467] Kolodrubetz, D.; Burgum, A. : Sequence and genetic analysis of NHP2: a moderately abundant high mobility group-like nuclear protein with an essential function in *Saccha-*

romyces cerevisiae. Yeast 7: 79–90, 1991. ; and

[63468] Saito, H.; Fujiwara, T.; Shin, S.; Okui, K.; Nakamura, Y. : Cloning and mapping of a human novel cDNA (NHP2L1) that encodes a protein highly homologous to yeast nuclear protein NHP2. Cy.

[63469] Further studies establishing the function and utilities of NHP2L1 are found in John Hopkins OMIM database record ID 601304, and in cited publications numbered 6510–6511 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM\_000901) is another VGAM1923 host target gene. NR3C2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NR3C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C2 BINDING SITE, designated SEQ ID:6598, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63470] Another function of VGAM1923 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 2

(NR3C2, Accession NM\_000901), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2. The function of NR3C2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817) is another VGAM1923 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23093, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63471] Another function of VGAM1923 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain.

Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. RAB11A, Member RAS Oncogene Family (RAB11A, Accession NM\_004663) is another VGAM1923 host target gene. RAB11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB11A BINDING SITE, designated SEQ ID:11034, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63472] Another function of VGAM1923 is therefore inhibition of RAB11A, Member RAS Oncogene Family (RAB11A, Accession NM\_004663). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB11A. RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM\_002869) is another VGAM1923 host target gene. RAB6A BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB6A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6A BINDING SITE, designated SEQ ID:8777, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63473] Another function of VGAM1923 is therefore inhibition of RAB6A, Member RAS Oncogene Family (RAB6A, Accession NM\_002869), a gene which is involved in protein trafficking. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6A. The function of RAB6A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM217. Arginine-glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102) is another VGAM1923 host target gene. RERE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14409, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63474] Another function of VGAM1923 is therefore inhibition of Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM\_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51.Sodium Channel, Voltage–gated, Type IV, Alpha Polypeptide (SCN4A, Accession NM\_000334) is another VGAM1923 host target gene. SCN4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN4A BINDING SITE, designated SEQ ID:5891, to the nucleotide sequence of

VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63475] Another function of VGAM1923 is therefore inhibition of Sodium Channel, Voltage-gated, Type IV, Alpha Polypeptide (SCN4A, Accession NM\_000334). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN4A. Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038) is another VGAM1923 host target gene. SLC1A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC1A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A4 BINDING SITE, designated SEQ ID:8998, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63476] Another function of VGAM1923 is therefore inhibition of Solute Carrier Family 1 (glutamate/neutral amino acid transporter), Member 4 (SLC1A4, Accession NM\_003038), a gene which transports alanine, serine, cysteine, and

threonine. exhibits sodium dependence. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A4. The function of SLC1A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM859. Synaptosomal-associated Protein, 23kDa (SNAP23, Accession NM\_003825) is another VGAM1923 host target gene. SNAP23 BINDING SITE1 and SNAP23 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNAP23, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE1 and SNAP23 BINDING SITE2, designated SEQ ID:9920 and SEQ ID:28285 respectively, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63477] Another function of VGAM1923 is therefore inhibition of Synaptosomal-associated Protein, 23kDa (SNAP23, Accession NM\_003825), a gene which is essential component of the high affinity receptor for the general membrane fusion

machinery. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23. The function of SNAP23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533. Synaptotagmin I (SYT1, Accession NM\_005639) is another VGAM1923 host target gene. SYT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT1 BINDING SITE, designated SEQ ID:12170, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63478] Another function of VGAM1923 is therefore inhibition of Synaptotagmin I (SYT1, Accession NM\_005639), a gene which may have a regulatory role in the membrane interactions during trafficking of synaptic vesicles at the active zone of the synapse. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT1. The function

of SYT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM739. Transcription Factor 8 (represses interleukin 2 expression) (TCF8, Accession NM\_030751) is another VGAM1923 host target gene. TCF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF8 BINDING SITE, designated SEQ ID:25038, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63479] Another function of VGAM1923 is therefore inhibition of Transcription Factor 8 (represses interleukin 2 expression) (TCF8, Accession NM\_030751), a gene which may be responsible for transcriptional repression of the il-2 gene and regulates the promoter activity of the atp1a1 gene. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF8. The function of TCF8 and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM166. Tumor Necrosis Factor (ligand) Superfamily, Member 9 (TNFSF9, Accession NM\_003811) is another VGAM1923 host target gene. TNFSF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF9 BINDING SITE, designated SEQ ID:9902, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63480] Another function of VGAM1923 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 9 (TNFSF9, Accession NM\_003811). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF9. Visual System Homeobox 1 Homolog, CHX10-like (zebrafish) (VSX1, Accession NM\_014588) is another VGAM1923 host target gene. VSX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VSX1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VSX1 BINDING SITE, designated SEQ ID:15956, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63481] Another function of VGAM1923 is therefore inhibition of Visual System Homeobox 1 Homolog, CHX10-like (zebrafish) (VSX1, Accession NM\_014588), a gene which is implicated in ocular development. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VSX1. The function of VSX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM665.WSX1 (Accession NM\_004843) is another VGAM1923 host target gene. WSX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WSX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSX1 BINDING SITE, designated SEQ ID:11256, to the nucleotide sequence of

VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63482] Another function of VGAM1923 is therefore inhibition of WSX1 (Accession NM\_004843), a gene which is a member of the class I cytokine receptor family and involved in the modulation of the immune response. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSX1. The function of WSX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1125. Tyrosine

3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Eta Polypeptide (YWHAH, Accession NM\_003405) is another VGAM1923 host target gene.

YWHAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of YWHAH BINDING SITE, designated SEQ ID:9439, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ

ID:4634.

[63483] Another function of VGAM1923 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Eta Polypeptide (YWHAH, Accession NM\_003405), a gene which activates tyrosine and tryptophan hydroxylases in the presence of and strongly activates protein kinase c. Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAH. The function of YWHAH has been established by previous studies. Protein 14-3-3 is a protein kinase-dependent activator of tyrosine and tryptophan hydroxylases (191290, 191060) and an endogenous inhibitor of protein kinase C (OMIM Ref. No. 176960). It was first described as a brain-specific bovine protein. It consists of acidic dimeric subunits of about 27 kD. Immunohistochemical analyses showed that the 14-3-3 protein is located exclusively in the cytoplasm of neurons in the cerebral cortex and is axonally transported to the nerve terminals. Electrophoresis and chromatography demonstrated that the 14-3-3 protein exists in at least 7 distinct forms: alpha, beta, gamma, delta, epsilon, zeta, and eta. Watanabe et al. (1994) found mRNA corresponding to an

eighth subtype, which they termed theta, in rat brain. The mRNA theta subtype was found in the gray matter of cerebellar cortex and the hippocampus, as well as in white matter where cell bodies of glial cells predominate. In contrast, mRNA of the zeta subtype was distributed widely in the brain gray matter with high levels of transcripts in the neocortex, hippocampus, caudate-putamen, thalamus, cerebellar cortex, and several brain stem nuclei. A human protein with phospholipase A2 activity was shown to be the zeta subtype of the 14-3-3 protein (Zupan et al., 1992). The gene is also symbolized YWHAH. Muratake et al. (1996) determined that the human YWHAH gene has 2 exons separated by an intron of approximately 8 kb. Using S1 nuclease mapping, primer extension, and RACE PCR, Muratake et al. (1996) identified the transcription initiation site. They also identified several regulatory element sequences, including CRE, in the 5-prime noncoding region. Muratake et al. (1996) noted that the presence of a CRE binding element may indicate that this gene is involved in brain responses to narcotics. The authors also found changes in a 7-bp repeat sequence (GCCTGCA) located in the noncoding region of exon 1 and they speculated that these changes, or other changes in the se-

quence of this gene, may be associated with neuropsychiatric disorders.

[63484] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63485] Muratake, T.; Hayashi, S.; Ichikawa, T.; Kumanishi, T.; Ichimura, Y.; Kuwano, R.; Isobe, T.; Wang, Y.; Minoshima, S.; Shimizu, N.; Takahashi, Y. : Structural organization and chromosomal assignment of the human 14-3-3-eta chain gene (YWHAH). Genomics 36: 63-69, 1996. ; and

[63486] Zupan, L. A.; Steffens, D. L.; Berry, C. A.; Landt, M.; Gross, R. W. : Cloning and expression of a human 14-3-3 protein mediating phospholipolysis. J. Biol. Chem. 267: 8707-8710, 1992.

[63487] Further studies establishing the function and utilities of YWHAH are found in John Hopkins OMIM database record ID 113508, and in cited publications numbered 4188-4193 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM1923 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18369, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63488] Another function of VGAM1923 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. AP1S3 (Accession XM\_059421) is another VGAM1923 host target gene. AP1S3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1S3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1S3 BINDING SITE, designated SEQ ID:36987, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63489] Another function of VGAM1923 is therefore inhibition of

AP1S3 (Accession XM\_059421). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S3. ARPP-19 (Accession NM\_006628) is another VGAM1923 host target gene. ARPP-19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARPP-19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-19 BINDING SITE, designated SEQ ID:13426, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63490] Another function of VGAM1923 is therefore inhibition of ARPP-19 (Accession NM\_006628). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-19. ATPase, H<sup>+</sup> Transporting, Lysosomal 56/58kDa, V1 Subunit B, Isoform 2 (ATP6V1B2, Accession NM\_001693) is another VGAM1923 host target gene. ATP6V1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1B2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1B2 BINDING SITE, designated SEQ ID:7415, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63491] Another function of VGAM1923 is therefore inhibition of ATPase, H<sup>+</sup> Transporting, Lysosomal 56/58kDa, V1 Subunit B, Isoform 2 (ATP6V1B2, Accession NM\_001693). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1B2. BLP2 (Accession NM\_025141) is another VGAM1923 host target gene. BLP2 BINDING SITE1 and BLP2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BLP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLP2 BINDING SITE1 and BLP2 BINDING SITE2, designated SEQ ID:24780 and SEQ ID:27800 respectively, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63492] Another function of VGAM1923 is therefore inhibition of BLP2 (Accession NM\_025141). Accordingly, utilities of

VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLP2. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821) is another VGAM1923 host target gene. C20orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28088, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63493] Another function of VGAM1923 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. Chromosome 20 Open Reading Frame 140 (C20orf140, Accession NM\_144628) is another VGAM1923 host target gene. C20orf140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf140, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf140 BINDING SITE, designated SEQ ID:29443, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63494] Another function of VGAM1923 is therefore inhibition of Chromosome 20 Open Reading Frame 140 (C20orf140, Accession NM\_144628). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf140. Chromosome 20 Open Reading Frame 3 (C20orf3, Accession XM\_042765) is another VGAM1923 host target gene. C20orf3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf3 BINDING SITE, designated SEQ ID:33766, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63495] Another function of VGAM1923 is therefore inhibition of

Chromosome 20 Open Reading Frame 3 (C20orf3, Accession XM\_042765). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf3. Chromosome 20 Open Reading Frame 81 (C20orf81, Accession NM\_022760) is another VGAM1923 host target gene. C20orf81 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C20orf81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf81 BINDING SITE, designated SEQ ID:23004, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63496] Another function of VGAM1923 is therefore inhibition of Chromosome 20 Open Reading Frame 81 (C20orf81, Accession NM\_022760). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf81. CDW92 (Accession NM\_080546) is another VGAM1923 host target gene. CDW92 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

CDW92, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDW92 BINDING SITE, designated SEQ ID:27868, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63497] Another function of VGAM1923 is therefore inhibition of CDW92 (Accession NM\_080546). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDW92. CED-6 (Accession NM\_016315) is another VGAM1923 host target gene. CED-6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CED-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CED-6 BINDING SITE, designated SEQ ID:18433, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63498] Another function of VGAM1923 is therefore inhibition of CED-6 (Accession NM\_016315). Accordingly, utilities of

VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CED-6. CHCR (Accession NM\_018388) is another VGAM1923 host target gene. CHCR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHCR BINDING SITE, designated SEQ ID:20422, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63499] Another function of VGAM1923 is therefore inhibition of CHCR (Accession NM\_018388). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHCR. DCOHM (Accession NM\_032151) is another VGAM1923 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE,

designated SEQ ID:25848, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63500] Another function of VGAM1923 is therefore inhibition of DCOHM (Accession NM\_032151). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. DKFZP434C131 (Accession XM\_044630) is another VGAM1923 host target gene. DKFZP434C131 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434C131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C131 BINDING SITE, designated SEQ ID:34245, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63501] Another function of VGAM1923 is therefore inhibition of DKFZP434C131 (Accession XM\_044630). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C131. DKFZp761G0313 (Accession

XM\_038026) is another VGAM1923 host target gene. DKFZp761G0313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G0313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G0313 BINDING SITE, designated SEQ ID:32742, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63502] Another function of VGAM1923 is therefore inhibition of DKFZp761G0313 (Accession XM\_038026). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0313. DKFZp762M136 (Accession XM\_035635) is another VGAM1923 host target gene. DKFZp762M136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp762M136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762M136 BINDING SITE, designated SEQ ID:32304, to the nucleotide sequence of

VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63503] Another function of VGAM1923 is therefore inhibition of DKFZp762M136 (Accession XM\_035635). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762M136. EDR2 (Accession XM\_018136) is another VGAM1923 host target gene. EDR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDR2 BINDING SITE, designated SEQ ID:30340, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63504] Another function of VGAM1923 is therefore inhibition of EDR2 (Accession XM\_018136). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR2. EFA6R (Accession NM\_015310) is another VGAM1923 host target gene. EFA6R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by EFA6R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFA6R BINDING SITE, designated SEQ ID:17626, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63505] Another function of VGAM1923 is therefore inhibition of EFA6R (Accession NM\_015310). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFA6R. ESDN (Accession NM\_080927) is another VGAM1923 host target gene. ESDN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESDN BINDING SITE, designated SEQ ID:28154, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63506] Another function of VGAM1923 is therefore inhibition of ESDN (Accession NM\_080927). Accordingly, utilities of

VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESDN. FLJ00007 (Accession XM\_048928) is another VGAM1923 host target gene. FLJ00007 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00007 BINDING SITE, designated SEQ ID:35312, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63507] Another function of VGAM1923 is therefore inhibition of FLJ00007 (Accession XM\_048928). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00007. FLJ12587 (Accession NM\_022480) is another VGAM1923 host target gene. FLJ12587 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12587, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12587

BINDING SITE, designated SEQ ID:22852, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63508] Another function of VGAM1923 is therefore inhibition of FLJ12587 (Accession NM\_022480). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12587. FLJ13055 (Accession NM\_022737) is another VGAM1923 host target gene. FLJ13055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13055 BINDING SITE, designated SEQ ID:22945, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63509] Another function of VGAM1923 is therefore inhibition of FLJ13055 (Accession NM\_022737). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13055. FLJ13315 (Accession NM\_025005) is another VGAM1923 host target gene. FLJ13315 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13315 BINDING SITE, designated SEQ ID:24577, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63510] Another function of VGAM1923 is therefore inhibition of FLJ13315 (Accession NM\_025005). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13315. FLJ13962 (Accession NM\_024862) is another VGAM1923 host target gene. FLJ13962 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13962 BINDING SITE, designated SEQ ID:24299, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63511] Another function of VGAM1923 is therefore inhibition of

FLJ13962 (Accession NM\_024862). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13962. FLJ14084 (Accession NM\_021637) is another VGAM1923 host target gene. FLJ14084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14084 BINDING SITE, designated SEQ ID:22286, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63512] Another function of VGAM1923 is therefore inhibition of FLJ14084 (Accession NM\_021637). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14084. FLJ20312 (Accession NM\_017761) is another VGAM1923 host target gene. FLJ20312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20312 BINDING SITE, designated SEQ ID:19376, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63513] Another function of VGAM1923 is therefore inhibition of FLJ20312 (Accession NM\_017761). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20312. FLJ20445 (Accession NM\_017824) is another VGAM1923 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19483, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63514] Another function of VGAM1923 is therefore inhibition of FLJ20445 (Accession NM\_017824). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445. FLJ22794 (Accession XM\_166220) is another

VGAM1923 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44034, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63515] Another function of VGAM1923 is therefore inhibition of FLJ22794 (Accession XM\_166220). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. FLJ32783 (Accession NM\_144968) is another VGAM1923 host target gene. FLJ32783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32783 BINDING SITE, designated SEQ ID:29584, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63516] Another function of VGAM1923 is therefore inhibition of FLJ32783 (Accession NM\_144968). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32783. GL004 (Accession XM\_038373) is another VGAM1923 host target gene. GL004 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GL004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GL004 BINDING SITE, designated SEQ ID:32828, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63517] Another function of VGAM1923 is therefore inhibition of GL004 (Accession XM\_038373). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GL004. HSJ1 (Accession NM\_006736) is another VGAM1923 host target gene. HSJ1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSJ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HSJ1 BINDING SITE, designated SEQ ID:13588, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63518] Another function of VGAM1923 is therefore inhibition of HSJ1 (Accession NM\_006736). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSJ1. IBTK (Accession XM\_041401) is another VGAM1923 host target gene. IBTK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IBTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IBTK BINDING SITE, designated SEQ ID:33518, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63519] Another function of VGAM1923 is therefore inhibition of IBTK (Accession XM\_041401). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IBTK.

KIAA0016 (Accession NM\_014765) is another VGAM1923 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16533, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63520] Another function of VGAM1923 is therefore inhibition of KIAA0016 (Accession NM\_014765). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. KIAA0090 (Accession XM\_114045) is another VGAM1923 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42653, to the nucleotide sequence of VGAM1923 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4634.

[63521] Another function of VGAM1923 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. KIAA0152 (Accession NM\_014730) is another VGAM1923 host target gene. KIAA0152 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0152 BINDING SITE, designated SEQ ID:16338, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63522] Another function of VGAM1923 is therefore inhibition of KIAA0152 (Accession NM\_014730). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0152. KIAA0285 (Accession NM\_014807) is another VGAM1923 host target gene. KIAA0285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0285, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0285 BINDING SITE, designated SEQ ID:16748, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63523] Another function of VGAM1923 is therefore inhibition of KIAA0285 (Accession NM\_014807). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0285. KIAA0459 (Accession XM\_027862) is another VGAM1923 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30577, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63524] Another function of VGAM1923 is therefore inhibition of KIAA0459 (Accession XM\_027862). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0459. KIAA0495 (Accession XM\_031397) is another VGAM1923 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31361, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63525] Another function of VGAM1923 is therefore inhibition of KIAA0495 (Accession XM\_031397). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA0574 (Accession XM\_045076) is another VGAM1923 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34346, to the

nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63526] Another function of VGAM1923 is therefore inhibition of KIAA0574 (Accession XM\_045076). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0574. KIAA0680 (Accession NM\_014721) is another VGAM1923 host target gene. KIAA0680 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0680, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0680 BINDING SITE, designated SEQ ID:16285, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63527] Another function of VGAM1923 is therefore inhibition of KIAA0680 (Accession NM\_014721). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0680. KIAA0800 (Accession NM\_014703) is another VGAM1923 host target gene. KIAA0800 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by KIAA0800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0800 BINDING SITE, designated SEQ ID:16238, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63528] Another function of VGAM1923 is therefore inhibition of KIAA0800 (Accession NM\_014703). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0800. KIAA0871 (Accession NM\_014961) is another VGAM1923 host target gene. KIAA0871 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0871 BINDING SITE, designated SEQ ID:17333, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63529] Another function of VGAM1923 is therefore inhibition of KIAA0871 (Accession NM\_014961). Accordingly, utilities

of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0871. KIAA1096 (Accession XM\_043678) is another VGAM1923 host target gene. KIAA1096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1096 BINDING SITE, designated SEQ ID:33997, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63530] Another function of VGAM1923 is therefore inhibition of KIAA1096 (Accession XM\_043678). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1096. KIAA1145 (Accession XM\_037790) is another VGAM1923 host target gene. KIAA1145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1145 BINDING SITE, designated SEQ ID:32683, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63531] Another function of VGAM1923 is therefore inhibition of KIAA1145 (Accession XM\_037790). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1145. KIAA1198 (Accession XM\_032674) is another VGAM1923 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31713, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63532] Another function of VGAM1923 is therefore inhibition of KIAA1198 (Accession XM\_032674). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1203 (Accession XM\_049683) is another VGAM1923 host target gene. KIAA1203 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35471, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63533] Another function of VGAM1923 is therefore inhibition of KIAA1203 (Accession XM\_049683). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. KIAA1209 (Accession XM\_027307) is another VGAM1923 host target gene. KIAA1209 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1209 BINDING SITE, designated SEQ ID:30472, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63534] Another function of VGAM1923 is therefore inhibition of

KIAA1209 (Accession XM\_027307). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1209. KIAA1277 (Accession XM\_035114) is another VGAM1923 host target gene. KIAA1277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1277 BINDING SITE, designated SEQ ID:32206, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63535] Another function of VGAM1923 is therefore inhibition of KIAA1277 (Accession XM\_035114). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1277. KIAA1301 (Accession XM\_038999) is another VGAM1923 host target gene. KIAA1301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1301 BINDING SITE, designated SEQ ID:32979, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63536] Another function of VGAM1923 is therefore inhibition of KIAA1301 (Accession XM\_038999). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1301. KIAA1497 (Accession XM\_041431) is another VGAM1923 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33530, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63537] Another function of VGAM1923 is therefore inhibition of KIAA1497 (Accession XM\_041431). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. KIAA1677 (Accession XM\_040383) is another

VGAM1923 host target gene. KIAA1677 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1677 BINDING SITE, designated SEQ ID:33293, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63538] Another function of VGAM1923 is therefore inhibition of KIAA1677 (Accession XM\_040383). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1677. KIAA1679 (Accession XM\_046570) is another VGAM1923 host target gene. KIAA1679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1679 BINDING SITE, designated SEQ ID:34753, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63539] Another function of VGAM1923 is therefore inhibition of KIAA1679 (Accession XM\_046570). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1679. KIAA1701 (Accession XM\_042087) is another VGAM1923 host target gene. KIAA1701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1701 BINDING SITE, designated SEQ ID:33686, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63540] Another function of VGAM1923 is therefore inhibition of KIAA1701 (Accession XM\_042087). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1701. KIAA1750 (Accession XM\_043067) is another VGAM1923 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:33878, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63541] Another function of VGAM1923 is therefore inhibition of KIAA1750 (Accession XM\_043067). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. KIAA1753 (Accession XM\_036115) is another VGAM1923 host target gene. KIAA1753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1753 BINDING SITE, designated SEQ ID:32381, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63542] Another function of VGAM1923 is therefore inhibition of KIAA1753 (Accession XM\_036115). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1753. LCP (Accession NM\_014315) is another VGAM1923 host target gene. LCP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LCP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCP BINDING SITE, designated SEQ ID:15615, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63543] Another function of VGAM1923 is therefore inhibition of LCP (Accession NM\_014315). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCP. LNIR (Accession NM\_030916) is another VGAM1923 host target gene. LNIR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LNIR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LNIR BINDING SITE, designated SEQ ID:25187, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ

ID:4634.

[63544] Another function of VGAM1923 is therefore inhibition of LNIR (Accession NM\_030916). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LNIR. Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM\_045261) is another VGAM1923 host target gene. LRRN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRN3 BINDING SITE, designated SEQ ID:34400, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63545] Another function of VGAM1923 is therefore inhibition of Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM\_045261). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRN3. Mitogen-activated Protein Kinase 11 (MAPK11, Accession NM\_002751) is another VGAM1923 host target gene. MAPK11 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAPK11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK11 BINDING SITE, designated SEQ ID:8629, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63546] Another function of VGAM1923 is therefore inhibition of Mitogen-activated Protein Kinase 11 (MAPK11, Accession NM\_002751). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK11. MASA (Accession XM\_035994) is another VGAM1923 host target gene. MASA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MASA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASA BINDING SITE, designated SEQ ID:32373, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63547] Another function of VGAM1923 is therefore inhibition of

MASA (Accession XM\_035994). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASA. MGC26655 (Accession NM\_138290) is another VGAM1923 host target gene. MGC26655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC26655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC26655 BINDING SITE, designated SEQ ID:28703, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63548] Another function of VGAM1923 is therefore inhibition of MGC26655 (Accession NM\_138290). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26655. MGC4677 (Accession NM\_052871) is another VGAM1923 host target gene. MGC4677 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4677, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC4677 BINDING SITE, designated SEQ ID:27453, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63549] Another function of VGAM1923 is therefore inhibition of MGC4677 (Accession NM\_052871). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4677. Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM\_145255) is another VGAM1923 host target gene. MRPL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL10 BINDING SITE, designated SEQ ID:29770, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63550] Another function of VGAM1923 is therefore inhibition of Mitochondrial Ribosomal Protein L10 (MRPL10, Accession NM\_145255). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with MRPL10. MSTP028 (Accession NM\_031954) is another VGAM1923 host target gene. MSTP028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP028 BINDING SITE, designated SEQ ID:25696, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63551] Another function of VGAM1923 is therefore inhibition of MSTP028 (Accession NM\_031954). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP028. Phosphodiesterase 3A, CGMP-inhibited (PDE3A, Accession NM\_000921) is another VGAM1923 host target gene. PDE3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE3A BINDING SITE, designated SEQ

ID:6632, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63552] Another function of VGAM1923 is therefore inhibition of Phosphodiesterase 3A, CGMP-inhibited (PDE3A, Accession NM\_000921). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE3A. Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751) is another VGAM1923 host target gene. PPFIA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPFIA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIA4 BINDING SITE, designated SEQ ID:34821, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63553] Another function of VGAM1923 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4,

Accession XM\_046751). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIA4. PR Domain Containing 12 (PRDM12, Accession NM\_021619) is another VGAM1923 host target gene. PRDM12 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRDM12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM12 BINDING SITE, designated SEQ ID:22254, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63554] Another function of VGAM1923 is therefore inhibition of PR Domain Containing 12 (PRDM12, Accession NM\_021619). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM12. RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM\_032144) is another VGAM1923 host target gene. RAB6C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB6C, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6C BINDING SITE, designated SEQ ID:25834, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63555] Another function of VGAM1923 is therefore inhibition of RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM\_032144). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6C. Sideroflexin 2 (SFXN2, Accession XM\_058359) is another VGAM1923 host target gene. SFXN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFXN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFXN2 BINDING SITE, designated SEQ ID:36606, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63556] Another function of VGAM1923 is therefore inhibition of Sideroflexin 2 (SFXN2, Accession XM\_058359). Accord-

ingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFXN2. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131) is another VGAM1923 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9104, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63557] Another function of VGAM1923 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM\_003131). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM\_037202) is another VGAM1923 host target gene. SS18L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SS18L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18L1 BINDING SITE, designated SEQ ID:32563, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63558] Another function of VGAM1923 is therefore inhibition of Synovial Sarcoma Translocation Gene On Chromosome 18-like 1 (SS18L1, Accession XM\_037202). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18L1. START Domain Containing 7 (STARD7, Accession NM\_139267) is another VGAM1923 host target gene. STARD7 BINDING SITE1 and STARD7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STARD7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE1 and STARD7 BINDING SITE2, designated SEQ ID:29262 and SEQ ID:21360 respectively, to the nucleotide sequence of VGAM1923 RNA, herein designated

VGAM RNA, also designated SEQ ID:4634.

[63559] Another function of VGAM1923 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM\_139267). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. TUSP (Accession NM\_020245) is another VGAM1923 host target gene. TUSP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUSP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUSP BINDING SITE, designated SEQ ID:21533, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63560] Another function of VGAM1923 is therefore inhibition of TUSP (Accession NM\_020245). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUSP. Williams-Beuren Syndrome Chromosome Region 17 (WBSCR17, Accession XM\_088168) is another VGAM1923 host target gene. WBSCR17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by WBSCR17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR17 BINDING SITE, designated SEQ ID:39548, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63561] Another function of VGAM1923 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 17 (WBSCR17, Accession XM\_088168). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR17. Zinc Finger RNA Binding Protein (ZFR, Accession NM\_016107) is another VGAM1923 host target gene. ZFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFR BINDING SITE, designated SEQ ID:18188, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63562] Another function of VGAM1923 is therefore inhibition of

Zinc Finger RNA Binding Protein (ZFR, Accession NM\_016107). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFR. LOC115286 (Accession XM\_055644) is another VGAM1923 host target gene.

LOC115286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115286 BINDING SITE, designated SEQ ID:36315, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63563] Another function of VGAM1923 is therefore inhibition of LOC115286 (Accession XM\_055644). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115286. LOC122830 (Accession XM\_058661) is another VGAM1923 host target gene. LOC122830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122830, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122830 BINDING SITE, designated SEQ ID:36708, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63564] Another function of VGAM1923 is therefore inhibition of LOC122830 (Accession XM\_058661). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122830. LOC126669 (Accession XM\_060121) is another VGAM1923 host target gene. LOC126669 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126669 BINDING SITE, designated SEQ ID:37158, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63565] Another function of VGAM1923 is therefore inhibition of LOC126669 (Accession XM\_060121). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC126669. LOC130639 (Accession XM\_059464) is another VGAM1923 host target gene. LOC130639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC130639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130639 BINDING SITE, designated SEQ ID:37002, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63566] Another function of VGAM1923 is therefore inhibition of LOC130639 (Accession XM\_059464). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130639. LOC143888 (Accession XM\_084669) is another VGAM1923 host target gene. LOC143888 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143888, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143888 BINDING SITE, designated SEQ ID:37671, to the nucleotide sequence of VGAM1923 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4634.

[63567] Another function of VGAM1923 is therefore inhibition of LOC143888 (Accession XM\_084669). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143888. LOC145009 (Accession XM\_016472) is another VGAM1923 host target gene. LOC145009 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145009 BINDING SITE, designated SEQ ID:30263, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63568] Another function of VGAM1923 is therefore inhibition of LOC145009 (Accession XM\_016472). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145009. LOC145581 (Accession XM\_085176) is another VGAM1923 host target gene. LOC145581 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145581, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145581 BINDING SITE, designated SEQ ID:37902, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63569] Another function of VGAM1923 is therefore inhibition of LOC145581 (Accession XM\_085176). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145581. LOC145820 (Accession XM\_085246) is another VGAM1923 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37991, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63570] Another function of VGAM1923 is therefore inhibition of LOC145820 (Accession XM\_085246). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC145820. LOC146712 (Accession XM\_097068) is another VGAM1923 host target gene. LOC146712 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146712 BINDING SITE, designated SEQ ID:40712, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63571] Another function of VGAM1923 is therefore inhibition of LOC146712 (Accession XM\_097068). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146712. LOC147136 (Accession XM\_085716) is another VGAM1923 host target gene. LOC147136 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147136 BINDING SITE, designated SEQ ID:38306, to

the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63572] Another function of VGAM1923 is therefore inhibition of LOC147136 (Accession XM\_085716). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147136. LOC147976 (Accession XM\_085980) is another VGAM1923 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38427, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63573] Another function of VGAM1923 is therefore inhibition of LOC147976 (Accession XM\_085980). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC149401 (Accession XM\_086511) is another VGAM1923 host target gene. LOC149401 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC149401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149401 BINDING SITE, designated SEQ ID:38738, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63574] Another function of VGAM1923 is therefore inhibition of LOC149401 (Accession XM\_086511). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149401. LOC149721 (Accession XM\_086649) is another VGAM1923 host target gene. LOC149721 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149721 BINDING SITE, designated SEQ ID:38811, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63575] Another function of VGAM1923 is therefore inhibition of LOC149721 (Accession XM\_086649). Accordingly, utilities

of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149721. LOC151475 (Accession XM\_098063) is another VGAM1923 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41359, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63576] Another function of VGAM1923 is therefore inhibition of LOC151475 (Accession XM\_098063). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. LOC153346 (Accession XM\_098364) is another VGAM1923 host target gene. LOC153346 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC153346 BINDING SITE, designated SEQ ID:41618, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63577] Another function of VGAM1923 is therefore inhibition of LOC153346 (Accession XM\_098364). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153346. LOC153592 (Accession XM\_098396) is another VGAM1923 host target gene. LOC153592 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153592 BINDING SITE, designated SEQ ID:41649, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63578] Another function of VGAM1923 is therefore inhibition of LOC153592 (Accession XM\_098396). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153592. LOC157922 (Accession XM\_098841) is another VGAM1923 host target gene. LOC157922 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157922, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157922 BINDING SITE, designated SEQ ID:41890, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63579] Another function of VGAM1923 is therefore inhibition of LOC157922 (Accession XM\_098841). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157922. LOC158476 (Accession XM\_098955) is another VGAM1923 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:42000, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63580] Another function of VGAM1923 is therefore inhibition of

LOC158476 (Accession XM\_098955). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC158709 (Accession XM\_088648) is another VGAM1923 host target gene. LOC158709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158709 BINDING SITE, designated SEQ ID:39883, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63581] Another function of VGAM1923 is therefore inhibition of LOC158709 (Accession XM\_088648). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158709. LOC160418 (Accession XM\_090286) is another VGAM1923 host target gene. LOC160418 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC160418 BINDING SITE, designated SEQ ID:39997, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63582] Another function of VGAM1923 is therefore inhibition of LOC160418 (Accession XM\_090286). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160418. LOC196027 (Accession XM\_113633) is another VGAM1923 host target gene. LOC196027 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196027, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196027 BINDING SITE, designated SEQ ID:42306, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63583] Another function of VGAM1923 is therefore inhibition of LOC196027 (Accession XM\_113633). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196027. LOC196955 (Accession XM\_085210) is an-

other VGAM1923 host target gene. LOC196955 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC196955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196955 BINDING SITE, designated SEQ ID:37941, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63584] Another function of VGAM1923 is therefore inhibition of LOC196955 (Accession XM\_085210). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196955. LOC199858 (Accession XM\_114040) is another VGAM1923 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42646, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63585] Another function of VGAM1923 is therefore inhibition of LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC199957 (Accession XM\_114068) is another VGAM1923 host target gene. LOC199957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199957 BINDING SITE, designated SEQ ID:42676, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63586] Another function of VGAM1923 is therefore inhibition of LOC199957 (Accession XM\_114068). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199957. LOC219722 (Accession XM\_167593) is another VGAM1923 host target gene. LOC219722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219722, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:44712, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63587] Another function of VGAM1923 is therefore inhibition of LOC219722 (Accession XM\_167593). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219722. LOC219735 (Accession XM\_167601) is another VGAM1923 host target gene. LOC219735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219735 BINDING SITE, designated SEQ ID:44721, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63588] Another function of VGAM1923 is therefore inhibition of LOC219735 (Accession XM\_167601). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219735. LOC220038 (Accession XM\_166257) is another VGAM1923 host target gene. LOC220038 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220038 BINDING SITE, designated SEQ ID:44080, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63589] Another function of VGAM1923 is therefore inhibition of LOC220038 (Accession XM\_166257). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220038. LOC256087 (Accession XM\_170823) is another VGAM1923 host target gene. LOC256087 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256087 BINDING SITE, designated SEQ ID:45602, to the nucleotide sequence of VGAM1923 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4634.

[63590] Another function of VGAM1923 is therefore inhibition of LOC256087 (Accession XM\_170823). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256087. LOC51706 (Accession XM\_046746) is another VGAM1923 host target gene. LOC51706 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51706, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51706 BINDING SITE, designated SEQ ID:34817, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63591] Another function of VGAM1923 is therefore inhibition of LOC51706 (Accession XM\_046746). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51706. LOC90075 (Accession XM\_028742) is another VGAM1923 host target gene. LOC90075 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90075, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90075 BINDING SITE, designated SEQ ID:30739, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63592] Another function of VGAM1923 is therefore inhibition of LOC90075 (Accession XM\_028742). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90075. LOC91380 (Accession XM\_038134) is another VGAM1923 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32757, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63593] Another function of VGAM1923 is therefore inhibition of LOC91380 (Accession XM\_038134). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91380. LOC91496 (Accession XM\_038788) is another VGAM1923 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91496 BINDING SITE, designated SEQ ID:32918, to the nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63594] Another function of VGAM1923 is therefore inhibition of LOC91496 (Accession XM\_038788). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496. LOC92912 (Accession XM\_047970) is another VGAM1923 host target gene. LOC92912 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92912 BINDING SITE, designated SEQ ID:35085, to the

nucleotide sequence of VGAM1923 RNA, herein designated VGAM RNA, also designated SEQ ID:4634.

[63595] Another function of VGAM1923 is therefore inhibition of LOC92912 (Accession XM\_047970). Accordingly, utilities of VGAM1923 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92912. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1924 (VGAM1924) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[63596] VGAM1924 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1924 was detected is described hereinabove with reference to Figs. 1–8.

[63597] VGAM1924 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[63598] VGAM1924 gene encodes a VGAM1924 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1924 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1924 precursor RNA is designated SEQ ID:1910, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1910 is located at position 1287 relative to the genome of Canine Distemper Virus.

[63599] VGAM1924 precursor RNA folds onto itself, forming VGAM1924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[63600] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1924 folded precursor RNA into VGAM1924 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1924 RNA is designated SEQ ID:4635, and is provided hereinbelow with reference to the sequence listing part.

[63601] VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1924 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[63602] VGAM1924 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1924 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1924 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[63603] The complementary binding of VGAM1924 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1924 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1924 host target RNA into VGAM1924 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[63604] It is appreciated that VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1924 host target genes. The mRNA of each one of this plurality of VGAM1924 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1924 RNA, herein designated VGAM RNA, and which when bound by VGAM1924 RNA causes inhibition of translation of respective one or more VGAM1924 host target proteins.

[63605] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1924 gene, herein designated VGAM GENE, on one or more VGAM1924 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[63606] It is yet further appreciated that a function of VGAM1924 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus. Specific functions, and accordingly utilities, of VGAM1924 correlate with, and may be deduced from, the identity of the host target genes which VGAM1924 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[63607] Nucleotide sequences of the VGAM1924 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1924 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1924 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1924 are further described hereinbelow with reference to Table 1.

[63608] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1924 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1924 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[63609] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1924 gene, herein designated VGAM is inhibition of expression of VGAM1924 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1924 correlate with, and may be deduced from, the identity of the target genes which VGAM1924 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[63610] ATP-binding Cassette, Sub-family D (ALD), Member 3 (ABCD3, Accession NM\_002858) is a VGAM1924 host target gene. ABCD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD3 BINDING SITE, designated SEQ ID:8754, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63611] A function of VGAM1924 is therefore inhibition of ATP-

binding Cassette, Sub-family D (ALD), Member 3 (ABCD3, Accession NM\_002858), a gene which a probable transporter. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD3. The function of ABCD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1775. ATP-binding Cassette, Sub-family D (ALD), Member 4 (ABCD4, Accession NM\_020325) is another VGAM1924 host target gene. ABCD4 BINDING SITE1 through ABCD4 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABCD4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCD4 BINDING SITE1 through ABCD4 BINDING SITE4, designated SEQ ID:21587, SEQ ID:21589, SEQ ID:21582 and SEQ ID:21584 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63612] Another function of VGAM1924 is therefore inhibition of ATP-binding Cassette, Sub-family D (ALD), Member 4

(ABCD4, Accession NM\_020325), a gene which Putative peroxisomal ATP binding cassette transporter. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCD4. The function of ABCD4 has been established by previous studies. The peroxisomal membrane contains several ATP-binding cassette (ABC) transporters, including PMP70 (PXMP1; 170995), ALDP (see OMIM Ref. No. 300100), and ALDR (ALDL1; 601081). All 3 proteins are ABC half-transporters, which dimerize to form an active transporter. See 603076. By searching an EST database for homologs of PMP70 and ALDP, Shani et al. (1997) and Holzinger et al. (1997) identified PXMP1L cDNAs. They respectively designated the gene P70R and PMP69. Shani et al. (1997) reported that the predicted 606-amino acid protein has the structure of an ABC half-transporter and shares 25 to 27% sequence identity with PMP70, ALDR, and ALDP. Antibodies against PXMP1L detected a 73-kD protein on Western blots. Immunofluorescence studies localized the protein to peroxisomes. Northern blot analysis revealed that PXMP1L was expressed as a 2.6-kb mRNA in all tissues examined. Holzinger et al. (1997) and Holzinger et al. (1998) found

transcript variants resulting from alternative splicing and use of alternative polyadenylation sites. Holzinger et al. (1998) reported that the PXMP1L gene contains 19 exons and spans approximately 16 kb.

[63613] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63614] Holzinger, A.; Roscher, A. A.; Landgraf, P.; Lichtner, P.; Kammerer, S. : Genomic organization and chromosomal localization of the human peroxisomal membrane protein-1-like protein (PXMP1-L) gene encoding a peroxisomal ABC transporter. FEBS Lett. 426: 238-242, 1998. ; and

[63615] Shani, N.; Jimenez-Sanchez, G.; Steel, G.; Dean, M.; Valle, D. : Identification of a fourth half ABC transporter in the human peroxisomal membrane. Hum. Molec. Genet. 6: 1925-1931, 1997.

[63616] Further studies establishing the function and utilities of ABCD4 are found in John Hopkins OMIM database record ID 603214, and in cited publications numbered 2432-2434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Acyl-Coenzyme A Dehydrogenase, Short/branched

Chain (ACADSB, Accession NM\_001609) is another VGAM1924 host target gene. ACADSB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:7313, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63617] Another function of VGAM1924 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM\_001609). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. Angiopoietin 1 (ANGPT1, Accession NM\_001146) is another VGAM1924 host target gene. ANGPT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ANGPT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANGPT1 BINDING SITE, designated SEQ ID:6814, to the

nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63618] Another function of VGAM1924 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM\_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM291. Amine Oxidase, Copper Containing 3 (vascular adhesion protein 1) (AOC3, Accession NM\_003734) is another VGAM1924 host target gene. AOC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AOC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOC3 BINDING SITE, designated SEQ ID:9825, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63619] Another function of VGAM1924 is therefore inhibition of

Amine Oxidase, Copper Containing 3 (vascular adhesion protein 1) (AOC3, Accession NM\_003734), a gene which catalyze the oxidative conversion of amines to aldehydes in the presence of copper and quinone cofactor. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOC3. The function of AOC3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM175. Aldehyde Oxidase 1 (AOX1, Accession NM\_001159) is another VGAM1924 host target gene. AOX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AOX1 BINDING SITE, designated SEQ ID:6826, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63620] Another function of VGAM1924 is therefore inhibition of Aldehyde Oxidase 1 (AOX1, Accession NM\_001159), a gene which converts an aldehyde in the presence of O<sub>2</sub> and H<sub>2</sub>O to an acid and HOOH. Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AOX1. The function of AOX1 has been established by previous studies. Aldehyde oxidase (AO) produces hydrogen peroxide and, under certain conditions, can catalyze the formation of superoxide. By PCR of a human liver library with primers based on conserved regions of rat and fly xanthine dehydrogenase (XDH) proteins, Wright et al. (1993) isolated a cDNA fragment. Using this fragment as a probe, they identified human liver cDNAs encoding a predicted 1,336-amino acid protein. The human protein was 49% identical to rat XDH and contained several characteristic XDH signature sequences. However, both Turner et al. (1995) and Berger et al. (1995) identified the cDNA isolated by Wright et al. (1993) as AO, or AOX1. By Northern blot analysis, Wright et al. (1993) determined that AOX1 was expressed as a 5.1-kb mRNA predominantly in liver. They suggested that a 4.5-kb transcript observed in heart, brain, and kidney arose by use of an alternative polyadenylation site. Since defects in oxygen radical metabolism have been implicated in the pathogenesis of the autosomal dominant form of amyotrophic lateral sclerosis (ALS; 105400), Berger et al. (1995) analyzed other

enzymes involved in oxygen radical metabolism for possible involvement in other forms of ALS. Analysis of a YAC contig revealed that the AOX1 gene is within 280 kb of the D2S116 marker, which is inseparable by recombination from the ALS2 (OMIM Ref. No. 205100) locus. Using in situ hybridization, Berger et al. (1995) found that AOX1 is expressed in the ventral horn of the spinal cord, primarily in the glial cells. Based on the tissue localization, linkage data, and the biochemical role of AOX1 in the free radical pathway, these authors suggested that AOX1 is a candidate gene for ALS2.

[63621] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63622] Berger, R.; Mezey, E.; Clancy, K. P.; Harta, G.; Wright, R. M.; Repine, J. E.; Brown, R. H.; Brownstein, M.; Patterson, D. : Analysis of aldehyde oxidase and xanthine dehydrogenase/oxidase as possible candidate genes for autosomal recessive familial amyotrophic lateral sclerosis. *Somat. Cell Molec. Genet.* 21: 121-131, 1995. ; and

[63623] Turner, N. A.; Doyle, W. A.; Ventom, A. M.; Bray, R. C. : Properties of rabbit liver aldehyde oxidase and the relationship of the enzyme to xanthine oxidase and dehydro-

genase. Europ. J.

[63624] Further studies establishing the function and utilities of AOX1 are found in John Hopkins OMIM database record ID 602841, and in cited publications numbered 1131–113 and 8638 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM\_003899) is another VGAM1924 host target gene. ARHGEF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF7 BINDING SITE, designated SEQ ID:9983, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63625] Another function of VGAM1924 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 7 (ARHGEF7, Accession NM\_003899), a gene which acts as a rac1 guanine nucleotide exchange factor (gef) and can induce membrane ruffling. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ARHGEF7. The function of ARHGEF7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM297.AS3 (Accession NM\_015928) is another VGAM1924 host target gene. AS3 BINDING SITE1 and AS3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AS3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AS3 BINDING SITE1 and AS3 BINDING SITE2, designated SEQ ID:18049 and SEQ ID:18052 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63626] Another function of VGAM1924 is therefore inhibition of AS3 (Accession NM\_015928), a gene which inhibits cell proliferation. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AS3. The function of AS3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM393.BCRP2

(Accession XM\_031102) is another VGAM1924 host target gene. BCRP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCRP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCRP2 BINDING SITE, designated SEQ ID:31275, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63627] Another function of VGAM1924 is therefore inhibition of BCRP2 (Accession XM\_031102). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCRP2. Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM\_030762) is another VGAM1924 host target gene. BHLHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB3 BINDING SITE, designated SEQ ID:25044, to the nucleotide sequence of

VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63628] Another function of VGAM1924 is therefore inhibition of Basic Helix–loop–helix Domain Containing, Class B, 3 (BHLHB3, Accession NM\_030762), a gene which represses both basal and activated transcription. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB3. The function of BHLHB3 has been established by previous studies. By searching EST databases for sequences similar to DEC1, followed by 5–prime and 3–prime RACE with chondrocyte cDNA, Fujimoto et al. (2001) obtained cDNAs encoding human and mouse DEC2. The deduced 482–amino acid human DEC2 protein contains a bHLH domain and an Orange domain that are highly conserved with those of mouse Dec2 and rat Sharp1. DEC2 also has a C–terminal alanine/glycine–rich region not seen in DEC1. Northern blot analysis detected a 3.6–kb DEC2 transcript that was highly expressed in skeletal muscle and brain, moderately expressed in pancreas and heart, expressed at low levels in placenta and lung, and expressed at very low levels in liver and kidney. RT–PCR analysis detected ubiquitous but variable expres–

sion of DEC2. Using yeast 1-hybrid screens and reporter analysis, Garriga-Canut et al. (2001) showed that rat Sharp1 binds to the M1 muscarinic acetylcholine receptor (see OMIM Ref. No. CHRM1; 118510) and acts as a transcriptional repressor of both TATA-containing and TATA-less promoters. Repression occurs either via the bHLH domain or via a C-terminal domain that is sensitive to the histone deacetylase inhibitor trichostatin A.

[63629] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63630] Garriga-Canut, M.; Roopra, A.; Buckley, N. J. : The basic helix-loop-helix protein, SHARP-1, represses transcription by a histone deacetylase-dependent and histone deacetylase-independent mechanism. J. Biol. Chem. 276: 14821-14828, 2001. ; and

[63631] Fujimoto, K.; Shen, M.; Noshiro, M.; Matsubara, K.; Shingu, S.; Honda, K.; Yoshida, E.; Suardita, K.; Matsuda, Y.; Kato, Y. : Molecular cloning and characterization of DEC2, a new memb.

[63632] Further studies establishing the function and utilities of BHLHB3 are found in John Hopkins OMIM database record ID 606200, and in cited publications numbered 902-903

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BLTR2 (Accession NM\_019839) is another VGAM1924 host target gene.

BLTR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BLTR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLTR2 BINDING SITE, designated SEQ ID:21243, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63633] Another function of VGAM1924 is therefore inhibition of BLTR2 (Accession NM\_019839). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLTR2. BRIP1 (Accession NM\_032043) is another VGAM1924 host target gene. BRIP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRIP1 BINDING SITE, designated SEQ

ID:25754, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63634] Another function of VGAM1924 is therefore inhibition of BRIP1 (Accession NM\_032043). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRIP1. BTG Family, Member 2 (BTG2, Accession NM\_006763) is another VGAM1924 host target gene. BTG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTG2 BINDING SITE, designated SEQ ID:13625, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63635] Another function of VGAM1924 is therefore inhibition of BTG Family, Member 2 (BTG2, Accession NM\_006763). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTG2. Calnexin (CANX, Accession XM\_113469) is another VGAM1924 host target gene.

CANX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CANX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CANX BINDING SITE, designated SEQ ID:42276, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63636] Another function of VGAM1924 is therefore inhibition of Calnexin (CANX, Accession XM\_113469), a gene which may function as a chaperone in the endoplasmic reticulum, involved in the secretion of proteins from the ER to the outer cellular membrane. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CANX. The function of CANX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM116. Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM\_052116) is another VGAM1924 host target gene. CAPZA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPZA1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPZA1 BINDING SITE, designated SEQ ID:35953, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63637] Another function of VGAM1924 is therefore inhibition of Capping Protein (actin filament) Muscle Z-line, Alpha 1 (CAPZA1, Accession XM\_052116), a gene which is alpha 1 subunit of actin filament capping protein; binds actin, has roles in cell motility and actin assembly. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPZA1. The function of CAPZA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM547. Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM\_006092) is another VGAM1924 host target gene. CARD4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CARD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CARD4 BINDING SITE, designated SEQ ID:12741, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63638] Another function of VGAM1924 is therefore inhibition of Caspase Recruitment Domain Family, Member 4 (CARD4, Accession NM\_006092), a gene which Activates CASP9 to induce apoptosis, regulates activation of NF-kappaB. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD4. The function of CARD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM492. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093) is another VGAM1924 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11553, to the nucleotide sequence of

VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63639] Another function of VGAM1924 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Core-binding Factor, Beta Subunit (CBFB, Accession NM\_022845) is another VGAM1924 host target gene. CBFB BINDING SITE1 and CBFB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBFB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFB BINDING SITE1 and CBFB BINDING SITE2, designated SEQ ID:23148 and SEQ ID:7507 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63640] Another function of VGAM1924 is therefore inhibition of Core-binding Factor, Beta Subunit (CBFB, Accession NM\_022845), a gene which is beta subunit of the transcription factor CBF which causes leukemia. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFB. The function of CBFB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98. Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932) is another VGAM1924 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11376, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63641] Another function of VGAM1924 is therefore inhibition of Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM\_004932), a gene which is a calcium depen-

dent cell adhesion protein. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM60. Centaurin, Delta 1 (CENTD1, Accession NM\_015230) is another VGAM1924 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2, designated SEQ ID:17564 and SEQ ID:29202 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63642] Another function of VGAM1924 is therefore inhibition of Centaurin, Delta 1 (CENTD1, Accession NM\_015230), a gene which is involved in cell signaling/communication. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with CENTD1. The function of CENTD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM445. Chorea Acanthocytosis (CHAC, Accession NM\_033305) is another VGAM1924 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:27140, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63643] Another function of VGAM1924 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM\_033305), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM650. Cysteine Knot Superfamily 1,

BMP Antagonist 1 (CKTSF1B1, Accession NM\_013372) is another VGAM1924 host target gene. CKTSF1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKTSF1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKTSF1B1 BINDING SITE, designated SEQ ID:15024, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63644] Another function of VGAM1924 is therefore inhibition of Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM\_013372), a gene which blocks signaling of bone morphogenetic protein (BMP) . Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKTSF1B1. The function of CKTSF1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM\_000391) is another VGAM1924 host target gene. CLN2 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by CLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN2 BINDING SITE, designated SEQ ID:5966, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63645] Another function of VGAM1924 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM\_000391). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN2. Cystinosis, Nephropathic (CTNS, Accession NM\_004937) is another VGAM1924 host target gene. CTNS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CTNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNS BINDING SITE, designated SEQ ID:11384, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4635.

[63646] Another function of VGAM1924 is therefore inhibition of Cystinosis, Nephropathic (CTNS, Accession NM\_004937). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNS. Cytochrome P450, Subfamily IIB (phenobarbital-inducible), Polypeptide 6 (CYP2B6, Accession NM\_000767) is another VGAM1924 host target gene. CYP2B6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP2B6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP2B6 BINDING SITE, designated SEQ ID:6417, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63647] Another function of VGAM1924 is therefore inhibition of Cytochrome P450, Subfamily IIB (phenobarbital-inducible), Polypeptide 6 (CYP2B6, Accession NM\_000767), a gene which oxidizes a variety of structurally unrelated compounds, including steroids, fatty acids, and xenobiotics. Accordingly, utilities of VGAM1924 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with CYP2B6. The function of CYP2B6 has been established by previous studies. Thum and Borlak (2000) investigated the gene expression of major human cytochrome P450 genes in various regions of explanted hearts from 6 patients with dilated cardiomyopathy and 1 with transposition of the arterial trunk and 2 samples of normal heart. mRNA for cytochrome 2B6 was predominantly expressed in the right ventricle. A strong correlation between tissue-specific gene expression and enzyme activity was found. Thum and Borlak (2000) concluded that their findings showed that expression of genes for cytochrome P450 monooxygenases and verapamil metabolism are found predominantly in the right side of the heart, and suggested that this observation may explain the lack of efficacy of certain cardioselective drugs. Using a cloned cDNA that codes for a human ortholog of the phenobarbital-inducible cytochrome P450IIB subfamily in rodents, Santisteban et al. (1988) localized the CYP2B gene family to 19cen-q13.3 by Southern blot hybridization to DNA extracted from a panel of human-rodent somatic cell hybrids. Miles et al. (1988) established the chromosomal localization of the CYP2B gene subfam-

ily to be 19q12–q13.2, close to the location of CYP2A (OMIM Ref. No. 123960), by Southern blot analysis of human–rodent somatic cell hybrids.

[63648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63649] Santisteban, I.; Povey, S.; Shephard, E. A.; Phillips, I. R. : The major phenobarbital–inducible cytochrome P–450 gene subfamily (P450IIB) mapped to the long arm of human chromosome 19. *Ann. Hum. Genet.* 52: 129–135, 1988. ; and

[63650] Thum, T.; Borlak, J. : Gene expression in distinct regions of the heart. *Lancet* 355: 979–983, 2000.

[63651] Further studies establishing the function and utilities of CYP2B6 are found in John Hopkins OMIM database record ID 605059, and in cited publications numbered 4708–470 and 11783 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dystroglycan 1 (dystrophin–associated glycoprotein 1) (DAG1, Accession NM\_004393) is another VGAM1924 host target gene. DAG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAG1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAG1 BINDING SITE, designated SEQ ID:10637, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63652] Another function of VGAM1924 is therefore inhibition of Dystroglycan 1 (dystrophin-associated glycoprotein 1) (DAG1, Accession NM\_004393), a gene which may provide linkage between the sarcolemma and extracellular matrix (ECM). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAG1. The function of DAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1095. Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM\_166516) is another VGAM1924 host target gene. DGKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DGKB BINDING SITE, designated SEQ ID:44451, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63653] Another function of VGAM1924 is therefore inhibition of Diacylglycerol Kinase, Beta 90kDa (DGKB, Accession XM\_166516), a gene which regulates the intracellular concentration of the second messenger diacylglycerol (DAG). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKB. The function of DGKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM497. Disrupted In Schizophrenia 1 (DISC1, Accession NM\_018662) is another VGAM1924 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20742, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63654] Another function of VGAM1924 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM\_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.DNA

(cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892) is another VGAM1924 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13766, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63655] Another function of VGAM1924 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B,

Accession NM\_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280. Diphtheria Toxin Receptor (heparin-binding epidermal growth factor-like growth factor) (DTR, Accession NM\_001945) is another VGAM1924 host target gene. DTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTR BINDING SITE, designated SEQ ID:7660, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63656] Another function of VGAM1924 is therefore inhibition of Diphtheria Toxin Receptor (heparin-binding epidermal growth factor-like growth factor) (DTR, Accession NM\_001945), a gene which may be involved in

macrophage-mediated cellular proliferation. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTR. The function of DTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM242.DXS1283E (Accession XM\_047871) is another VGAM1924 host target gene. DXS1283E BINDING SITE1 and DXS1283E BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DXS1283E, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE1 and DXS1283E BINDING SITE2, designated SEQ ID:35066 and SEQ ID:35068 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63657] Another function of VGAM1924 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DXS1283E. Dual-specificity tyrosine-(Y)-phosphorylation

Regulated Kinase 1A (DYRK1A, Accession NM\_130436) is another VGAM1924 host target gene. DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE1 through DYRK1A BINDING SITE3, designated SEQ ID:28189, SEQ ID:7094 and SEQ ID:7679 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63658] Another function of VGAM1924 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_130436), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42.Endothelin Receptor Type B (EDNRB, Accession

NM\_003991) is another VGAM1924 host target gene. EDNRB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EDNRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDNRB BINDING SITE, designated SEQ ID:10148, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63659] Another function of VGAM1924 is therefore inhibition of Endothelin Receptor Type B (EDNRB, Accession NM\_003991), a gene which is a non-specific receptor for endothelin 1, 2, and 3. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDNRB. The function of EDNRB has been established by previous studies. The 5-prime region of EDNRB is a complex CpG island giving rise to 4 individual transcripts initiating within the island. Pao et al. (2001) analyzed the relationship between methylation and EDNRB expression in human tissues. The CpG island was unmethylated in normal prostate and bladder tissue, whereas it was methylated in colonic ep-

ithelium; DNA from tumors derived from these tissues was frequently hypermethylated. Analysis of 11 individual CpG sites in the CpG island showed that specific sites with high methylation levels in several tumors and cancer cell lines were also methylated in normal tissues, suggesting that these sites might serve as foci for further de novo methylation. A low methylation level in a small region within the 5-prime region correlated with expression of the 5-prime-most transcript, whereas almost complete methylation 200 to 1000 bp downstream of the transcriptional start site did not block expression of this transcript. Treatment with 5-aza-2-prime-deoxycytidine induced transcriptional activation of all 4 EDNRB transcripts. The authors concluded that there is differential, tissue-dependent methylation at the EDNRB 5-prime region, and that hypermethylation immediately 3-prime to the transcriptional start site does not prevent initiation. They further proposed a spreading mechanism for de novo methylation, starting from particular methylation hotspots. Animal model experiments lend further support to the function of EDNRB. The role of the endothelin-B receptor in vascular homeostasis is controversial because the receptor has both pressor and depressor effects in vivo. Spot-

ting lethal rats carry a naturally occurring deletion in the endothelin-B receptor gene that completely abrogates functional receptor expression. Rats homozygous for this mutation die shortly after birth due to congenital distal intestinal aganglionosis. Genetic rescue of homozygous rats from this developmental defect using a dopamine hydroxylase-EDNRB transgene resulted in ETB-deficient adult rats Gariépy et al. (2000). On a sodium-deficient diet, the rats exhibited a normal arterial blood pressure, but on a high-sodium diet the homozygous sl rats became severely hypertensive. Normal pressure was restored in the salt-fed rats when the epithelial sodium channel was blocked with amiloride. Gariépy et al. (2000) concluded that the rescued sl/sl rats are a novel single-locus genetic model of severe salt-sensitive hypertension. The results suggested that these rats are hypertensive because they lack the normal tonic inhibition of the renal epithelial sodium channel.

[63660] It is appreciated that the abovementioned animal model for EDNRB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[63661] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [63662] Pao, M. M.; Tsutsumi, M.; Liang, G.; Uzvolgyi, E.; Gonzales, F. A.; Jones, P. A. : The endothelin receptor B (EDNRB) promoter displays heterogeneous, site specific methylation patterns in normal and tumor cells. Hum. Molec. Genet. 10: 903–910, 2001. ; and
- [63663] Gariepy, C. E.; Ohuchi, T.; Williams, S. C.; Richardson, J. A.; Yanagisawa, M. : Salt-sensitive hypertension in endothelin-B receptor-deficient rats. J. Clin. Invest. 105: 925–933, 2000.
- [63664] Further studies establishing the function and utilities of EDNRB are found in John Hopkins OMIM database record ID 131244, and in cited publications numbered 4040–4043, 2290, 12215–4053, 2642, 2587–2590, 2280, 2591–260 and 2286 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134) is another VGAM1924 host target gene. FABP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FABP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FABP2 BINDING SITE, designated SEQ ID:5624, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63665] Another function of VGAM1924 is therefore inhibition of Fatty Acid Binding Protein 2, Intestinal (FABP2, Accession NM\_000134), a gene which may have a role in dietary fat uptake or processing. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP2. The function of FABP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM951. Fibulin 5 (FBLN5, Accession NM\_006329) is another VGAM1924 host target gene. FBLN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBLN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN5 BINDING SITE, designated SEQ ID:13023, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA,

also designated SEQ ID:4635.

[63666] Another function of VGAM1924 is therefore inhibition of Fibulin 5 (FBLN5, Accession NM\_006329), a gene which promotes adhesion of endothelial cells through interaction of integrins and the rgd motif. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN5. The function of FBLN5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1127.F-box and Leucine-rich Repeat Protein 7 (FBXL7, Accession NM\_012304) is another VGAM1924 host target gene. FBXL7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL7 BINDING SITE, designated SEQ ID:14671, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63667] Another function of VGAM1924 is therefore inhibition of F-box and Leucine-rich Repeat Protein 7 (FBXL7, Acces-

sion NM\_012304), a gene which may be involved in phosphorylation-dependent ubiquitination. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL7. The function of FBXL7 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40-amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F-box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134, F-box proteins), which function in phosphorylation-dependent ubiquitination. Using a yeast 2-hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F-box proteins, respectively. These contained C termini with leucine-rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Winston et al. (1999) predicted the presence of 12 leucine-rich repeats (LRRs) in FBXL7. RT-PCR analysis detected strong expression in all tissues tested, with highest levels in heart, kidney, liver, and lung.

[63668] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63669] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XII. The complete sequences of 100 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 5: 355–364, 1998. ; and

[63670] Winston, J. T.; Koepp, D. M.; Zhu, C.; Elledge, S. J.; Harper, J. W. : A family of mammalian F-box proteins. Curr. Biol. 9: 1180–1182, 1999.

[63671] Further studies establishing the function and utilities of FBXL7 are found in John Hopkins OMIM database record ID 605656, and in cited publications numbered 40 and 8278 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FCRH1 (Accession NM\_052938) is another VGAM1924 host target gene. FCRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FCRH1 BINDING SITE, designated SEQ ID:27500, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63672] Another function of VGAM1924 is therefore inhibition of FCRH1 (Accession NM\_052938). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCRH1. Frizzled Homolog 8 (Drosophila) (FZD8, Accession NM\_031866) is another VGAM1924 host target gene. FZD8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD8 BINDING SITE, designated SEQ ID:25623, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63673] Another function of VGAM1924 is therefore inhibition of Frizzled Homolog 8 (Drosophila) (FZD8, Accession NM\_031866), a gene which may be involved in transduction and intercellular transmission of polarity information during tissue morphogenesis and/or in differentiated tis-

sues. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD8. The function of FZD8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM503.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3) (GALNT3, Accession NM\_004482) is another VGAM1924 host target gene. GALNT3 BINDING SITE1 and GALNT3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GALNT3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT3 BINDING SITE1 and GALNT3 BINDING SITE2, designated SEQ ID:10803 and SEQ ID:10804 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63674] Another function of VGAM1924 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3) (GALNT3, Accession NM\_004482), a gene which initiates O-

glycosylation of serine and threonine residues. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT3. The function of GALNT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1565. Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM\_002065) is another VGAM1924 host target gene. GLUL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUL BINDING SITE, designated SEQ ID:7837, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63675] Another function of VGAM1924 is therefore inhibition of Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM\_002065), a gene which catalyzes the condensation of glutamate and ammonia to form glutamine. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with GLUL. The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM948. Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM\_002074) is another VGAM1924 host target gene. GNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB1 BINDING SITE, designated SEQ ID:7851, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63676] Another function of VGAM1924 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM\_002074). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB1. Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM\_000841) is another VGAM1924 host target gene. GRM4 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by GRM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRM4 BINDING SITE, designated SEQ ID:6505, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63677] Another function of VGAM1924 is therefore inhibition of Glutamate Receptor, Metabotropic 4 (GRM4, Accession NM\_000841), a gene which is mediated by a g-protein that inhibits adenylate cyclase activity. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRM4. The function of GRM4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1052. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is another VGAM1924 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45223, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63678] Another function of VGAM1924 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Homeo Box B3 (HOXB3, Accession NM\_002146) is another VGAM1924 host target gene. HOXB3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HOXB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXB3 BINDING SITE, designated SEQ

ID:7922, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63679] Another function of VGAM1924 is therefore inhibition of Homeo Box B3 (HOXB3, Accession NM\_002146). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXB3. Heat Shock 70kDa Protein 8 (HSPA8, Accession NM\_006597) is another VGAM1924 host target gene. HSPA8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA8 BINDING SITE, designated SEQ ID:13371, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63680] Another function of VGAM1924 is therefore inhibition of Heat Shock 70kDa Protein 8 (HSPA8, Accession NM\_006597), a gene which acts as a chaperone. plays an important role in cells by transiently associating with nascent polypeptides to facilitate correct folding. Accord-

ingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA8. The function of HSPA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM258. Inhibitor of DNA Binding 4, Dominant Negative Helix-loop-helix Protein (ID4, Accession NM\_001546) is another VGAM1924 host target gene. ID4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ID4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ID4 BINDING SITE, designated SEQ ID:7272, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63681] Another function of VGAM1924 is therefore inhibition of Inhibitor of DNA Binding 4, Dominant Negative Helix-loop-helix Protein (ID4, Accession NM\_001546), a gene which negatively regulates cell differentiation. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ID4. The function of ID4 and its association with

various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM931. Interleukin 10 Receptor, Alpha (IL10RA, Accession XM\_006447) is another VGAM1924 host target gene. IL10RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL10RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL10RA BINDING SITE, designated SEQ ID:29997, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63682] Another function of VGAM1924 is therefore inhibition of Interleukin 10 Receptor, Alpha (IL10RA, Accession XM\_006447), a gene which is a receptor for il-10. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL10RA. The function of IL10RA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134. Interleukin 8 (IL8, Accession XM\_170504) is another VGAM1924 host target

gene. IL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL8 BINDING SITE, designated SEQ ID:45338, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63683] Another function of VGAM1924 is therefore inhibition of Interleukin 8 (IL8, Accession XM\_170504). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL8. inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM\_005536) is another VGAM1924 host target gene. IMPA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPA1 BINDING SITE, designated SEQ ID:12057, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63684] Another function of VGAM1924 is therefore inhibition of inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM\_005536), a gene which is responsible for the provision of inositol required for synthesis of phosphatidylinositol and polyphosphoinositides. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPA1. The function of IMPA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134. Inhibin, Beta B (activin AB beta polypeptide) (INHBB, Accession NM\_002193) is another VGAM1924 host target gene. INHBB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INHBB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INHBB BINDING SITE, designated SEQ ID:7949, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63685] Another function of VGAM1924 is therefore inhibition of Inhibin, Beta B (activin AB beta polypeptide) (INHBB, Ac-

cession NM\_002193), a gene which inhibits inhibit the secretion of follitropin by the pituitary gland. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBB. The function of INHBB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1465. Jerky Homolog-like (mouse) (JRKL, Accession NM\_003772) is another VGAM1924 host target gene. JRKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JRKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRKL BINDING SITE, designated SEQ ID:9855, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63686] Another function of VGAM1924 is therefore inhibition of Jerky Homolog-like (mouse) (JRKL, Accession NM\_003772), a gene which is a Jerky-related protein and similar to centromere binding protein-B and other nuclear regulators. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with JRKL. The function of JRKL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1546. Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 3 (KCNA3, Accession NM\_002232) is another VGAM1924 host target gene. KCNA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA3 BINDING SITE, designated SEQ ID:8013, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63687] Another function of VGAM1924 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 3 (KCNA3, Accession NM\_002232). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA3. Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession

NM\_018658) is another VGAM1924 host target gene.

KCNJ16 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNJ16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ16 BINDING SITE, designated SEQ ID:20728, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63688] Another function of VGAM1924 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 16 (KCNJ16, Accession NM\_018658). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ16. Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM\_003679) is another VGAM1924 host target gene. KMO BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KMO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KMO BINDING SITE, desig-

nated SEQ ID:9782, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63689] Another function of VGAM1924 is therefore inhibition of Kynurenine 3-monooxygenase (kynurenine 3-hydroxylase) (KMO, Accession NM\_003679), a gene which may play a role in encephalic photoreception. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KMO. The function of KMO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM162. Like-glycosyltransferase (LARGE, Accession NM\_004737) is another VGAM1924 host target gene. LARGE BINDING SITE1 and LARGE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LARGE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LARGE BINDING SITE1 and LARGE BINDING SITE2, designated SEQ ID:11130 and SEQ ID:28602 respectively, to the nucleotide sequence of

VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63690] Another function of VGAM1924 is therefore inhibition of Like-glycosyltransferase (LARGE, Accession NM\_004737), a gene which is a member of the N-acetylglucosaminyltransferase family. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LARGE. The function of LARGE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM205. Methyl-CpG Binding Domain Protein 1 (MBD1, Accession NM\_002384) is another VGAM1924 host target gene. MBD1 BINDING SITE1 through MBD1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MBD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBD1 BINDING SITE1 through MBD1 BINDING SITE4, designated SEQ ID:8202, SEQ ID:17972, SEQ ID:17973 and SEQ ID:17974 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated

VGAM RNA, also designated SEQ ID:4635.

[63691] Another function of VGAM1924 is therefore inhibition of Methyl-CpG Binding Domain Protein 1 (MBD1, Accession NM\_002384), a gene which bind specifically to methylated DNA via a methyl-CpG-binding domain (MBD). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBD1. The function of MBD1 has been established by previous studies. Attempts to understand how DNA methylation prevents transcription have centered on 2 alternative mechanisms: direct interference of site-specific methylation with the binding of essential transcription factors, and indirect interference of promoter-proximal methylation with transcription via a protein that binds to methylated DNA. Methyl-CpG-binding protein-1 (MECP1) binds to a variety of methylated sequences in vitro, provided they contain at least 12 symmetrically methylated CpGs. MECP1 has been detected in crude nuclear extracts. Boyes and Bird (1991) and Levine et al. (1991) presented evidence suggesting that the MECP1 protein is a mediator of repression. Methylation of cytosines within the sequence CpG is essential for mouse development and has been linked to transcriptional sup-

pression in vertebrate systems. Methyl-CpG-binding proteins MECP1 and MECP2 (OMIM Ref. No. 300005) bind preferentially to methylated DNA and can inhibit transcription. The rat Mecp2 gene was cloned by Nan et al. (1993) and its methyl-CpG-binding domain (MBD) defined. By searching DNA sequence databases with the MBD sequence, Cross et al. (1997) identified a human cDNA with potential to encode an MBD-like region. Sequencing of the complete cDNA revealed that the open reading frame also encodes 2 cysteine-rich domains that were found in animal DNA methyltransferases (see OMIM Ref. No. DNMT; 126375) and in the mammalian HRX protein, also known as MLL and ALL-1 (OMIM Ref. No. 159555). They designated the protein PCM1 for 'protein containing MBD.' Expressed in bacteria, it showed specific binding to methylated DNA. PCM1 also repressed transcription in vitro in a methylation-dependent manner. A polyclonal antibody raised against the protein was able to bind the native MECP1 complex from HeLa cells, indicating that PCM1 is a component of mammalian MECP1. Using PCR on a hybrid panel and FISH, Hendrich et al. (1999) mapped the MBD1 gene to chromosome 18q21, 2.1 cM distal to MBD2 (OMIM Ref. No. 603547). They mapped the murine

gene to chromosome 18.

[63692] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63693] Boyes, J.; Bird, A. : DNA methylation inhibits transcription indirectly via a methyl-CpG binding protein. Cell 64: 1123-1134, 1991. ; and

[63694] Levine, A.; Cantoni, G. L.; Razin, A. : Inhibition of promoter activity by methylation: possible involvement of protein mediators. Proc. Nat. Acad. Sci. 88: 6515-6518, 1991.

[63695] Further studies establishing the function and utilities of MBD1 are found in John Hopkins OMIM database record ID 156535, and in cited publications numbered 2224-222 and 12709-12711 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Multiple Endocrine Neoplasia I (MEN1, Accession XM\_167804) is another VGAM1924 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of MEN1 BINDING SITE, designated SEQ ID:44845, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63696] Another function of VGAM1924 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM\_167804). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Myotubular Myopathy 1 (MTM1, Accession NM\_000252) is another VGAM1924 host target gene. MTM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTM1 BINDING SITE, designated SEQ ID:5792, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63697] Another function of VGAM1924 is therefore inhibition of Myotubular Myopathy 1 (MTM1, Accession NM\_000252). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTM1.

5-methyltetrahydrofolate-homocysteine Methyltransferase (MTR, Accession NM\_000254) is another VGAM1924 host target gene. MTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTR BINDING SITE, designated SEQ ID:5796, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63698] Another function of VGAM1924 is therefore inhibition of 5-methyltetrahydrofolate-homocysteine Methyltransferase (MTR, Accession NM\_000254). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTR. V-myc Myelocytomatosis Viral Related Oncogene, Neuroblastoma Derived (avian) (MYCN, Accession NM\_005378) is another VGAM1924 host target gene. MYCN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of MYCN BINDING SITE, designated SEQ ID:11860, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63699] Another function of VGAM1924 is therefore inhibition of V-myc Myelocytomatosis Viral Related Oncogene, Neuroblastoma Derived (avian) (MYCN, Accession NM\_005378), a gene which may function as a transcription factor. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCN. The function of MYCN has been established by previous studies. Reiter and Brodeur (1996) generated a high-resolution restriction map of approximately 500 kb spanning the MYCN locus. They found that deletions and rearrangements of the amplicon occurred less often in primary tumors than in cell lines. They also defined a 130-kb common core region of the MYCN amplicon that was amplified in 32 of 33 neuroblastomas. The authors proposed that despite the large size of most MYCN amplicons, the core region that is consistently amplified in neuroblastomas probably contains the MYCN gene and little else. Armstrong and Krystal

(1992) identified NCYM (OMIM Ref. No. 605374) as a gene that overlaps with MYCN; however, it is transcribed from the opposite DNA strand. The 2 genes appear to be coregulated in tumor cell lines. Guo et al. (1999) performed a comprehensive analysis of deletions of 11q in neuroblastomas: 295 sporadic, 15 familial, and 21 tumor-derived cell lines. Loss of heterozygosity (LOH) analysis was performed at 24 microsatellite loci spanning 11q. LOH was observed at multiple 11q loci in 129 of 295 (44%) sporadic neuroblastomas, 5 of 15 (33%) familial neuroblastomas, and 5 of 21 (24%) neuroblastoma cell lines. A single region of 2.1 cM within 11q23.3, flanked by markers D11S1340 and D11S1299, was deleted in all specimens with 11q LOH. Allelic loss at 11q23 was inversely related to MYCN amplification ( $P$  less than 0.001). Within the subset of cases with a single copy of MYCN, 11q LOH was associated with advanced stage disease, unfavorable histopathology, and decreased overall survival probability. However, 11q LOH was not independently prognostic in multivariate analyses. These data were judged to support the hypothesis that a tumor suppressor gene mapping within 11q23.3 is commonly inactivated during the malignant evolution of a large subset of neu-

roblastomas, especially those with unamplified MYCN.

[63700] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63701] Guo, C.; White, P. S.; Weiss, M. J.; Hogarty, M. D.; Thompson, P. M.; Stram, D. O.; Gerbing, R.; Matthay, K. K.; Seeger, R. C.; Brodeur, G. M.; Maris, J. M. : Allelic deletion at 11q23 is common in MYCN single copy neuroblastomas. *Oncogene* 18: 4948–4957, 1999. ; and

[63702] Reiter, J. L.; Brodeur, G. M. : High-resolution mapping of a 130-kb core region of the MYCN amplicon in neuroblastomas. *Genomics* 32: 97–103, 1996.

[63703] Further studies establishing the function and utilities of MYCN are found in John Hopkins OMIM database record ID 164840, and in cited publications numbered 1728–174 and 1814 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myeloid Differentiation Primary Response Gene (88) (MYD88, Accession NM\_002468) is another VGAM1924 host target gene. MYD88 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYD88, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MYD88 BINDING SITE, designated SEQ ID:8297, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63704] Another function of VGAM1924 is therefore inhibition of Myeloid Differentiation Primary Response Gene (88) (MYD88, Accession NM\_002468), a gene which is involved in the toll-like receptor and il-1 receptor signaling pathway in the innate immune response. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYD88. The function of MYD88 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656) is another VGAM1924 host target gene. NEU3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEU3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ

ID:13458, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63705] Another function of VGAM1924 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3. Neuralized-like (Drosophila) (NEURL, Accession NM\_004210) is another VGAM1924 host target gene. NEURL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEURL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEURL BINDING SITE, designated SEQ ID:10413, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63706] Another function of VGAM1924 is therefore inhibition of Neuralized-like (Drosophila) (NEURL, Accession NM\_004210). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEURL. Neurogenic Differ-

entiation 1 (NEUROD1, Accession NM\_002500) is another VGAM1924 host target gene. NEUROD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEUROD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEUROD1 BINDING SITE, designated SEQ ID:8324, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63707] Another function of VGAM1924 is therefore inhibition of Neurogenic Differentiation 1 (NEUROD1, Accession NM\_002500), a gene which acts as a differentiation factor during neurogenesis. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEUROD1. The function of NEUROD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM130. Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310) is another VGAM1924 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:13001, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63708] Another function of VGAM1924 is therefore inhibition of Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM\_006310), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS. The function of NPEPPS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83. Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM\_009699) is another VGAM1924 host target gene. NRIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NRIP1 BINDING SITE, designated SEQ ID:30119, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63709] Another function of VGAM1924 is therefore inhibition of Nuclear Receptor Interacting Protein 1 (NRIP1, Accession XM\_009699), a gene which modulates transcriptional activation by the estrogen receptor. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRIP1. The function of NRIP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276. Ornithine Aminotransferase (gyrate atrophy) (OAT, Accession NM\_000274) is another VGAM1924 host target gene. OAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAT BINDING SITE, designated SEQ ID:5816, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63710] Another function of VGAM1924 is therefore inhibition of Ornithine Aminotransferase (gyrate atrophy) (OAT, Accession NM\_000274). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAT. Oligophrenin 1 (OPHN1, Accession NM\_002547) is another VGAM1924 host target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8400, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63711] Another function of VGAM1924 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM\_002547). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. Oncostatin M (OSM, Accession NM\_020530) is another VGAM1924 host target gene. OSM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSM, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSM BINDING SITE, designated SEQ ID:21755, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63712] Another function of VGAM1924 is therefore inhibition of Oncostatin M (OSM, Accession NM\_020530), a gene which inhibits the proliferation of a number of tumor cell lines, caused an acute inflammatory reaction. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSM. The function of OSM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1078. Protocadherin Beta 12 (PCDHB12, Accession NM\_018932) is another VGAM1924 host target gene. PCDHB12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB12 BINDING SITE, designated

SEQ ID:21004, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63713] Another function of VGAM1924 is therefore inhibition of Protocadherin Beta 12 (PCDHB12, Accession NM\_018932). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB12. Protocadherin Beta 7 (PCDHB7, Accession NM\_018940) is another VGAM1924 host target gene. PCDHB7 BINDING SITE1 and PCDHB7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHB7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB7 BINDING SITE1 and PCDHB7 BINDING SITE2, designated SEQ ID:21006 and SEQ ID:21010 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63714] Another function of VGAM1924 is therefore inhibition of Protocadherin Beta 7 (PCDHB7, Accession NM\_018940). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with PCDHB7. Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM\_003768) is another VGAM1924 host target gene. PEA15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEA15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEA15 BINDING SITE, designated SEQ ID:9847, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63715] Another function of VGAM1924 is therefore inhibition of Phosphoprotein Enriched In Astrocytes 15 (PEA15, Accession NM\_003768), a gene which is a phosphoprotein and involved in glucose uptake. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEA15. The function of PEA15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949. Pleckstrin Homology-like Domain, Family A, Member 3 (PHLDA3, Accession NM\_012396) is another VGAM1924 host target gene. PHLDA3 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHLDA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHLDA3 BINDING SITE, designated SEQ ID:14759, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63716] Another function of VGAM1924 is therefore inhibition of Pleckstrin Homology-like Domain, Family A, Member 3 (PHLDA3, Accession NM\_012396). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHLDA3. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM\_014110) is another VGAM1924 host target gene. PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R8, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3, designated SEQ ID:15341, SEQ ID:8571

and SEQ ID:28857 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63717] Another function of VGAM1924 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM\_014110), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM101. Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM\_002734) is another VGAM1924 host target gene. PRKAR1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR1A BINDING SITE, designated SEQ ID:8606, to the nucleotide sequence of VGAM1924

RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63718] Another function of VGAM1924 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type I, Alpha (tissue specific extinguisher 1) (PRKAR1A, Accession NM\_002734). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR1A. Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM\_002765) is another VGAM1924 host target gene. PRPS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRPS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPS2 BINDING SITE, designated SEQ ID:8656, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63719] Another function of VGAM1924 is therefore inhibition of Phosphoribosyl Pyrophosphate Synthetase 2 (PRPS2, Accession NM\_002765), a gene which generates the PRPP needed for initiation of purine biosynthesis. Accordingly, utilities of VGAM1924 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PRPS2. The function of PRPS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM828. PSA (Accession NM\_058179) is another VGAM1924 host target gene. PSA BINDING SITE1 and PSA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSA BINDING SITE1 and PSA BINDING SITE2, designated SEQ ID:27739 and SEQ ID:22130 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63720] Another function of VGAM1924 is therefore inhibition of PSA (Accession NM\_058179), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSA. The function of PSA and its association with various diseases and clinical conditions, has been established by previous studies, as described here-

inabove with reference to VGAM65.Phosphotriesterase Related (PTER, Accession NM\_030664) is another VGAM1924 host target gene. PTER BINDING SITE1 and PTER BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTER, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE1 and PTER BINDING SITE2, designated SEQ ID:24996 and SEQ ID:24997 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63721] Another function of VGAM1924 is therefore inhibition of Phosphotriesterase Related (PTER, Accession NM\_030664), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER. The function of PTER and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM713.Protein Tyrosine Phosphatase, Receptor Type, G (PTPRG, Accession NM\_002841) is another VGAM1924 host target gene. PT-

PRG BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTPRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRG BINDING SITE, designated SEQ ID:8727, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63722] Another function of VGAM1924 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, G (PTPRG, Accession NM\_002841), a gene which is a candidate tumor suppressor and represents a subfamily of receptor tyrosine phosphatases. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRG. The function of PTPRG has been established by previous studies. Changes in the level and pattern of phosphorylation of protein tyrosyl residues are implicated in the control of cellular proliferation. The level of phosphorylation within cells is the result of a balance between the opposing activities of protein-tyrosine kinases and protein-tyrosine phosphatases (PTPs). As more members of the PTP family are cloned, 2 distinct classes have emerged: one class, the

cytoplasmic PTPs, are small soluble proteins; the other class, the receptor PTPs, are large transmembrane proteins. Kaplan et al. (1990) cloned 3 human receptor PTP genes. By analysis of rodent–human somatic cell hybrids retaining overlapping subsets of the entire human genome, LaForgia et al. (1991) mapped the PTPG gene to 3p21–p14. By comparison with other genes mapping to that region, they concluded that PTPG is located in band 3p21 centromeric to the 3p breakpoint in a t(3;8) chromosomal translocation. They showed that 1 PTPG allele was lost in 3 of 5 renal carcinoma cell lines and in 5 of 10 lung carcinoma tumor samples tested. PTPG mRNA was expressed in kidney cell lines and lung cell lines but not in several hematopoietic cell lines tested. Thus the PTPG gene appeared to have characteristics suggesting it as a candidate tumor suppressor gene in renal and lung carcinoma. Latif et al. (1993) localized the PTPRG gene to 3p14.2 by fluorescence in situ hybridization. D3S1249, which represents the PTPRG locus, was localized between D3S1187 and D3S1188 at a recombination fraction of 0.022 and 0.025, respectively, by linkage analysis using the CEPH pedigree panel (Tory et al., 1992). Barnea et al. (1993) cloned cDNAs for the human and mouse PTPRG

gene (symbolized RPTP-gamma by them) from brain cDNA libraries and analyzed their predicted polypeptide sequences. The human (1,445-amino acid) and mouse (1,442-amino acid) sequences share 95% identity at the amino acid level and predict a putative extracellular domain, a single transmembrane domain, and a cytoplasmic region with 2 tandem catalytic tyrosine phosphatase domains. The extracellular domain contains a stretch of 266 amino acids that are highly similar to the zinc-containing enzyme carbonic anhydrase (OMIM Ref. No. 114800), suggesting that RPTP-gamma and RPTP-beta (PTPRZ; 176891) represent a subfamily of receptor tyrosine phosphatases.

[63723] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63724] Barnea, G.; Silvennoinen, O.; Shaanan, B.; Honegger, A. M.; Canoll, P. D.; D'Eustachio, P.; Morse, B.; Levy, J. B.; Laforgia, S.; Huebner, K.; Musacchio, J. M.; Sap, J.; Schlessinger, J. : Identification of a carbonic anhydrase-like domain in the extracellular region of RPTP-gamma defines a new subfamily of receptor tyrosine phosphatases. *Molec. Cell. Biol.* 13: 1497-1506, 1993. ; and

[63725] Latif, F.; Tory, K.; Modi, W.; Geil, L.; LaForgia, S.; Huebner, K.; Zbar, B.; Lerman, M. I. : A MspI polymorphism and linkage mapping of the human protein-tyrosine phosphatase G (PTPRG).

[63726] Further studies establishing the function and utilities of PTPRG are found in John Hopkins OMIM database record ID 176886, and in cited publications numbered 10580, 10890-1058 and 2450 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_002848) is another VGAM1924 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:8740, SEQ ID:25005, SEQ ID:25013, SEQ ID:25022 and SEQ ID:25033 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63727] Another function of VGAM1924 is therefore inhibition of

Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_002848), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140.RGL (Accession NM\_015149) is another VGAM1924 host target gene. RGL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGL BINDING SITE, designated SEQ ID:17506, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63728] Another function of VGAM1924 is therefore inhibition of RGL (Accession NM\_015149), a gene which is involved in nucleotide exchange factor. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGL.

The function of RGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM861. Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession XM\_033595) is another VGAM1924 host target gene. RNASE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNASE1 BINDING SITE, designated SEQ ID:31944, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63729] Another function of VGAM1924 is therefore inhibition of Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession XM\_033595), a gene which is a Pancreatic ribonuclease; a pyrimidine-specific endonuclease that generates 2',3'-cyclic phosphate products. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE1. The function of RNASE1 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM210. Ring Finger Protein 14 (RNF14, Accession NM\_004290) is another VGAM1924 host target gene. RNF14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF14 BINDING SITE, designated SEQ ID:10504, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63730] Another function of VGAM1924 is therefore inhibition of Ring Finger Protein 14 (RNF14, Accession NM\_004290), a gene which associates with the androgen receptor (AR); functions as a transcriptional coactivator. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF14. The function of RNF14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM827. Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM\_000330) is another VGAM1924

host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RS1 BINDING SITE, designated SEQ ID:5874, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63731] Another function of VGAM1924 is therefore inhibition of Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM\_000330). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RS1. Reticulon 1 (RTN1, Accession NM\_021136) is another VGAM1924 host target gene. RTN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RTN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RTN1 BINDING SITE, designated SEQ ID:22109, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63732] Another function of VGAM1924 is therefore inhibition of Reticulon 1 (RTN1, Accession NM\_021136), a gene which may be involved in neuroendocrine secretion or in membrane – membrane trafficking in neuroendocrine cells. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RTN1. The function of RTN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM337. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is another VGAM1924 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7498, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63733] Another function of VGAM1924 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid

leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Runt-related Transcription Factor 3 (RUNX3, Accession NM\_004350) is another VGAM1924 host target gene. RUNX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX3 BINDING SITE, designated SEQ ID:10549, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63734] Another function of VGAM1924 is therefore inhibition of Runt-related Transcription Factor 3 (RUNX3, Accession NM\_004350), a gene which binds to the core site, 5'-pygpyggt-3', of a number of enhancers and promoters. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX3. The function of RUNX3 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM1151.SAR1 (Accession NM\_020150) is another VGAM1924 host target gene. SAR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAR1 BINDING SITE, designated SEQ ID:21353, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63735] Another function of VGAM1924 is therefore inhibition of SAR1 (Accession NM\_020150), a gene which is involved in transport from the endoplasmic reticulum to the golgi apparatus (by similarity). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAR1. The function of SAR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM222.Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM\_002999) is another VGAM1924 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SDC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8893, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63736] Another function of VGAM1924 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM\_002999), a gene which is a cell surface proteoglycan. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC4. The function of SDC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 13 (SERPINB13, Accession NM\_012397) is another VGAM1924 host target gene. SERPINB13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SER-

PINB13 BINDING SITE, designated SEQ ID:14762, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63737] Another function of VGAM1924 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 13 (SERPINB13, Accession NM\_012397), a gene which plays a role in the proliferation or differentiation of keratinocytes. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SERPINB13. The function of SERPINB13 has been established by previous studies. Abts et al. (1999) reported the cloning and characterization of PI13, a novel keratinocyte-associated member of the ovalbumin (ov) family of serpins showing a predominant expression in cells of the human keratinocyte cell line HaCaT and in lesional keratinocytes from psoriatic skin. Initially identified as a UV-repressible gene in HaCaT cells (Abts et al., 1997), this novel serpin is also called 'HaCaT UV-repressible serpin,' or hurpin. Abts et al. (1999) found that the full-length PI13 cDNA encodes a putative 391-amino acid protein with a predicted molecular mass of approximately 44 kD. PI13 shares nearly 59% amino acid identity with SCCA1 (OMIM Ref. No.

600517) and SCCA2 (OMIM Ref. No. 600518). By differential display RT-PCR of oral cavity squamous epithelium, database searching, and screening a keratinocyte cDNA library, Spring et al. (1999) obtained a cDNA encoding PI13, which they termed headpin. Sequence analysis predicted that the 391-amino acid protein contains an inhibitory serpin hinge region, a reactive site loop near the C terminus, and a penultimate serine residue found in all ov-serpin family members. Northern blot analysis detected a 3.3-kb transcript in normal oral mucosa but not in tumor-derived oral mucosa; no expression was detected in any other tissue tested. Relative RT-PCR analysis confirmed low or undetectable expression in squamous carcinoma and head and neck tumor cell lines compared with normal oral mucosa.

[63738] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63739] Abts, H. F.; Welss, T.; Mirmohammadsadegh, A.; Kohrer, K.; Michel, G.; Ruzicka, T. : Cloning and characterization of hurpin (protease inhibitor 13): a new skin-specific, UV-repressible serine proteinase inhibitor of the ovalbumin serpin family. J. Molec. Biol. 293: 29-39, 1999. ; and

[63740] Spring, P.; Nakashima, T.; Frederick, M.; Henderson, Y.; Clayman, G. : Identification and cDNA cloning of headpin, a novel differentially expressed serpin that maps to chromosome 18q. B.

[63741] Further studies establishing the function and utilities of SERPINB13 are found in John Hopkins OMIM database record ID 604445, and in cited publications numbered 1092–1095 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Splicing Factor 1 (SF1, Accession NM\_004630) is another VGAM1924 host target gene. SF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SF1 BINDING SITE, designated SEQ ID:11002, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63742] Another function of VGAM1924 is therefore inhibition of Splicing Factor 1 (SF1, Accession NM\_004630), a gene which is a transcriptional repressor and splicing factor. Accordingly, utilities of VGAM1924 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with SF1. The function of SF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM934. SH3-domain GRB2-like 2 (SH3GL2, Accession NM\_003026) is another VGAM1924 host target gene. SH3GL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL2 BINDING SITE, designated SEQ ID:8968, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63743] Another function of VGAM1924 is therefore inhibition of SH3-domain GRB2-like 2 (SH3GL2, Accession NM\_003026), a gene which plays a role in synaptic vesicle recycling, in particular in clathrin-mediated vesicle endocytosis. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL2. The function of SH3GL2 and its association with various diseases and clin-

ical conditions, has been established by previous studies, as described hereinabove with reference to VGAM982.Solute Carrier Family 29 (nucleoside transporters), Member 1 (SLC29A1, Accession NM\_004955) is another VGAM1924 host target gene. SLC29A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC29A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC29A1 BINDING SITE, designated SEQ ID:11398, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63744] Another function of VGAM1924 is therefore inhibition of Solute Carrier Family 29 (nucleoside transporters), Member 1 (SLC29A1, Accession NM\_004955), a gene which mediates both influx and efflux of nucleosides across the membrane. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC29A1. The function of SLC29A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1908.Small Nuclear Ribonucleoprotein Polypeptide N (SNRPN, Accession NM\_022807) is another VGAM1924 host target gene. SNRPN BINDING SITE1 and SNRPN BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNRPN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNRPN BINDING SITE1 and SNRPN BINDING SITE2, designated SEQ ID:23083 and SEQ ID:23085 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63745] Another function of VGAM1924 is therefore inhibition of Small Nuclear Ribonucleoprotein Polypeptide N (SNRPN, Accession NM\_022807), a gene which may be involved in tissue-specific alternative RNA processing events. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNRPN. The function of SNRPN has been established by previous studies. Cattanach et al. (1992) reported observations indicating that maternal duplication of the central part of mouse chromosome 7, where the *Snrpn* gene is located, causes an imprinting effect that

may correspond to PWS. Paternal duplication was not associated with any detectable effect that might correspond with Angelman syndrome (AS; 105830). Mutirangura et al. (1993) constructed a complete YAC contig of the Prader-Willi/Angelman chromosome region and localized the SNRPN gene to specific YACs within the contig. The small nuclear ribonucleoprotein subunit SmN, thought to be involved in splicing of pre-mRNA, is predominantly expressed in brain. The mouse homolog of the SNRPN gene is functionally imprinted in mouse brain, being expressed only from the paternally derived chromosome. Glenn et al. (1993) demonstrated functional imprinting of the human SNRPN gene using RT-PCR. No expression was observed in cultured skin fibroblasts of patients with Prader-Willi syndrome but was found in all patients with Angelman syndrome and in normal controls. Glenn et al. (1993) also demonstrated a parent-specific DNA methylation imprint within intron 5 of the SNRPN gene, which suggested an epigenetic mechanism by which parent-specific expression of this gene might be inherited. Thus, the authors found that the pattern of imprinting fulfills one major criterion for SNRPN being involved in the pathogenesis of PWS. Reed and Leff (1994) characterized a sequence poly-

morphism within expressed portions of the human SNRPN gene and showed that the SNRPN gene is monoallelically expressed in fetal brain and heart and in adult brain.

Analysis of maternal DNA and of SNRPN cDNA confirmed that the maternal allele is not expressed in fetal brain and heart. Thus, maternal imprinting of SNRPN supports the hypothesis that paternal absence of SNRPN is responsible for the PWS phenotype. Kuslich et al. (1999) likewise identified a de novo balanced translocation in a Prader-Willi syndrome patient: (4;15)(q27;q11.2)pat. The breakpoints lay between SNRPN exons 2 and 3. Parental-origin studies indicated that there was no uniparental disomy and no apparent deletion. The patient expressed ZNF127, SNRPN exons 1 and 2, IPW, and PAR1, but did not express either SNRPN exons 3 and 4 or PAR5, as assayed by RT-PCR, of peripheral blood cells. Kuslich et al. (1999) concluded that this patient and that reported by Sun et al. (1996) supported the contention that an intact genomic region and/or transcription of SNRPN exons 2 and 3 play a pivotal role in the manifestations of the major clinical phenotype in PWS. Prader-Willi syndrome and Angelman syndrome are neurogenetic disorders caused by the lack of a paternal or a maternal contribution from human 15q11-q13,

respectively. They involve oppositely imprinted genes: the paternally expressed PWS gene(s) and the maternally expressed AS gene. Deletions in the transcription unit of the imprinted SNRPN gene occur in patients who have PWS or Angelman syndrome because of a parental imprint switch failure in this chromosomal domain. It has been suggested that the SNRPN exon 1 region, which is deleted in PWS patients, contains an imprint switch element from which the maternal and paternal epigenotypes of the 15q11-q13 domain originate. Using the model organism *Drosophila*, Lyko et al. (1998) showed that a fragment from this region can function as a silencer in transgenic flies. Repression was detected specifically from this element and could not be observed with control human sequences. Additional experiments allowed the delineation of the silencer to a fragment of 215 bp containing the SNRPN promoter region. These results provide an additional link between genomic imprinting and an evolutionarily conserved silencing mechanism. Lyko et al. (1998) suggested that the identified element participates in the long-range regulation of the imprinted 15q11-q13 domain or locally represses SNRPN expression from the maternal allele. Animal model experiments lend further sup-

port to the function of SNRPN. Cattanach et al. (1992) reported observations indicating that maternal duplication of the central part of mouse chromosome 7, where the Snrpn gene is located, causes an imprinting effect that may correspond to PWS. Paternal duplication was not associated with any detectable effect that might correspond with Angelman syndrome (AS; 105830).

[63746] It is appreciated that the abovementioned animal model for SNRPN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[63747] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63748] Wirth, J.; Back, E.; Huttenhofer, A.; Nothwang, H.-G.; Lich, C.; Gross, S.; Menzel, C.; Schinzel, A.; Kioschis, P.; Tommerup, N.; Ropers, H.-H.; Horsthemke, B.; Buiting, K. : A translocation breakpoint cluster disrupts the newly defined 3-prime end of the SNURF-SNRPN transcription unit on chromosome 15. Hum. Molec. Genet. 10: 201-210, 2001. ; and

[63749] Sun, Y.; Nicholls, R. D.; Butler, M. G.; Saitoh, S.; Hainline, B. E.; Palmer, C. G. : Breakage in the SNRPN locus in a bal-

anced 46,XY,t(15;19) Prader-Willi syndrome patient. Hum. Molec. Ge.

[63750] Further studies establishing the function and utilities of SNRPN are found in John Hopkins OMIM database record ID 182279, and in cited publications numbered 1631, 2993-2994, 4204-2998, 48, 2999-3007, 488 and 12400-12405 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696) is another VGAM1924 host target gene. SPOCK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPOCK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPOCK BINDING SITE, designated SEQ ID:31456, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63751] Another function of VGAM1924 is therefore inhibition of Sparc/osteonectin, Cwcv and Kazal-like Domains Proteoglycan (testican) (SPOCK, Accession XM\_031696). Accordingly, utilities of VGAM1924 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with SPOCK. ST3GALVI (Accession NM\_006100) is another VGAM1924 host target gene. ST3GALVI BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ST3GALVI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST3GALVI BINDING SITE, designated SEQ ID:12746, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63752] Another function of VGAM1924 is therefore inhibition of ST3GALVI (Accession NM\_006100), a gene which has a role in synthesis of sialyl-paragloboside. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST3GALVI. The function of ST3GALVI has been established by previous studies. Using mouse St3galv (SIAT9; 604402) as the probe, Okajima et al. (1999) cloned ST3GALVI from a human melanoma cDNA library. The deduced 331-amino acid protein has a calculated molecular mass of about 38 kD. It contains an N-terminal type II transmembrane domain, 2 sialylmotifs, a C-terminal motif

conserved among ST3GAL subfamily members, and 6 potential N-linked glycosylation sites. The ST3GALVI protein shares 38%, 34%, and 33% identity with ST3GALIV, ST3GALIII, and mouse St3galv, respectively. Northern blot analysis revealed abundant expression of 1.8- and 3.0-kb transcripts in heart, placenta, and liver, with lower levels in most other tissues tested. Taniguchi et al. (2001) determined that the ST3GALVI gene contains 10 exons and spans more than 62 kb. They identified 2 unique promoter regions corresponding to 2 mRNA species. The promoters have different constellations of putative transcriptional factor-binding sites, and the type-2 mRNA promoter lacks a canonical TATA box found in the type-1 mRNA promoter.

[63753] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[63754] Okajima, T.; Fukumoto, S.; Miyazaki, H.; Ishida, H.; Kiso, M.; Furukawa, K.; Urano, T.; Furukawa, K. : Molecular cloning of a novel alpha-2,3-sialyltransferase (ST3Gal VI) that sialylates type II lactosamine structures on glycoproteins and glycolipids. J. Biol. Chem. 274: 11479-11486, 1999. ; and

[63755] Taniguchi, A.; Kaneta, R.; Morishita, K.; Matsumoto, K. :  
Gene structure and transcriptional regulation of human  
Gal beta-1,4(3) GlcNac alpha-2,3-sialyltransferase VI  
(hST3Gal VI) gene.

[63756] Further studies establishing the function and utilities of  
ST3GALVI are found in John Hopkins OMIM database  
record ID 607156, and in cited publications numbered  
557 and 5577 listed in the bibliography section hereinbe-  
low, which are also hereby incorporated by refer-  
ence. Signal Transducer and Activator of Transcription 3  
(acute-phase response factor) (STAT3, Accession  
NM\_003150) is another VGAM1924 host target gene.  
STAT3 BINDING SITE1 through STAT3 BINDING SITE4 are  
HOST TARGET binding sites found in untranslated regions  
of mRNA encoded by STAT3, corresponding to HOST TAR-  
GET binding sites such as BINDING SITE I, BINDING SITE II  
or BINDING SITE III. Table 2 illustrates the complementar-  
ity of the nucleotide sequences of STAT3 BINDING SITE1  
through STAT3 BINDING SITE4, designated SEQ ID:9123,  
SEQ ID:9124, SEQ ID:29270 and SEQ ID:29271 respec-  
tively, to the nucleotide sequence of VGAM1924 RNA,  
herein designated VGAM RNA, also designated SEQ  
ID:4635.

[63757] Another function of VGAM1924 is therefore inhibition of Signal Transducer and Activator of Transcription 3 (acute-phase response factor) (STAT3, Accession NM\_003150), a gene which carries out a dual function: signal transduction and activation of transcription. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT3. The function of STAT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM329. Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662) is another VGAM1924 host target gene. TRPM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM6 BINDING SITE, designated SEQ ID:19202, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63758] Another function of VGAM1924 is therefore inhibition of

Transient Receptor Potential Cation Channel, Subfamily M, Member 6 (TRPM6, Accession NM\_017662), a gene which contains a predicted ion channel domain and a protein kinase domain. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM6. The function of TRPM6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173. Translin (TSN, Accession NM\_004622) is another VGAM1924 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10989, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63759] Another function of VGAM1924 is therefore inhibition of Translin (TSN, Accession NM\_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM1924

include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98. Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316) is another VGAM1924 host target gene. TTC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTC3 BINDING SITE, designated SEQ ID:9315, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63760] Another function of VGAM1924 is therefore inhibition of Tetratricopeptide Repeat Domain 3 (TTC3, Accession NM\_003316), a gene which contains tetratricopeptide repeat (TPR) motifs. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTC3. The function of TTC3 and its association with various diseases and clinical conditions, has been established by previous studies, as

described hereinabove with reference to VGAM699.UPF3B (Accession NM\_080632) is another VGAM1924 host target gene. UPF3B BINDING SITE1 and UPF3B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UPF3B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPF3B BINDING SITE1 and UPF3B BINDING SITE2, designated SEQ ID:27935 and SEQ ID:23274 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63761] Another function of VGAM1924 is therefore inhibition of UPF3B (Accession NM\_080632), a gene which facilitates the export of spliced mRNAs and may function as a positive regulator for mannosylphosphate transferase. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPF3B. The function of UPF3B has been established by previous studies. Lykke-Andersen et al. (2000) found that UPF2, UPF3A, and UPF3B were complexed with UPF1 (RENT1; 601430) while in HeLa cell extracts. In intact cells, UPF3A and UPF3B were found to be

nucleocytoplasmic shuttling proteins, while UPF2 was perinuclear, and UPF1 was cytoplasmic. UPF3A and UPF3B associated selectively with spliced beta-globin (OMIM Ref. No. 141900) mRNA in vivo, and tethering of any UPF protein to the 3-prime untranslated region of beta-globin mRNA elicited NMD. These data suggested that assembly of a dynamic human UPF complex initiates in the nucleus at mRNA exon-exon junctions and triggers NMD in the cytoplasm when recognized downstream of a translation termination site. By immunoprecipitation and immunoblot analyses of nucleoplasmic fractions, Kim et al. (2001) showed that UPF3A and UPF3B are associated in an RNase-resistant manner with Y14 (RBM8A; 605313), as well as with the mRNA export factors ALY (OMIM Ref. No. 604171) and TAP (NXF1; 602647), in mRNA-protein complexes. UPF3 proteins appeared to bind immediately upstream of exon-exon junctions. Kim et al. (2001) concluded that UPF3 proteins facilitate the export of spliced mRNAs by recruiting mRNA export proteins. They proposed that UPF3 functions in NMD and travels with the mRNA to the cytoplasm, where a leading translating ribosome displaces the UPF3-Y14 complexes from the mRNA.

[63762] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [63763] Lykke-Andersen, J.; Shu, M.-D.; Steitz, J. A. : Human Upf proteins target an mRNA for nonsense-mediated decay when bound downstream of a termination codon. Cell 103: 1121-1131, 2000. ; and
- [63764] Kim, V. N.; Kataoka, N.; Dreyfuss, G. : Role of the non-sense-mediated decay factor hUpf3 in the splicing-dependent exon-exon junction complex. Science 293: 1832-1836, 2001.
- [63765] Further studies establishing the function and utilities of UPF3B are found in John Hopkins OMIM database record ID 300298, and in cited publications numbered 9142-9145 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM\_012479) is another VGAM1924 host target gene. YWHAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of YWHAG BINDING SITE, designated SEQ ID:14859, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63766] Another function of VGAM1924 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM\_012479), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG. The function of YWHAG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM\_003406) is another VGAM1924 host target gene. YWHAZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of YWHAZ BINDING SITE, designated SEQ ID:9446, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63767] Another function of VGAM1924 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM\_003406), a gene which mediates signal transduction by binding to phosphorylated serine residues on a variety of signaling molecules. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAZ. The function of YWHAZ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM43. YY1 Transcription Factor (YY1, Accession NM\_003403) is another VGAM1924 host target gene. YY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YY1 BINDING SITE, designated SEQ ID:9438, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[63768] Another function of VGAM1924 is therefore inhibition of YY1 Transcription Factor (YY1, Accession NM\_003403), a gene which is involved in transcriptional regulation and may play an important role in development and differentiation. Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YY1. The function of YY1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1032. Zinc Finger Protein 103 Homolog (mouse) (ZFP103, Accession NM\_005667) is another VGAM1924 host target gene. ZFP103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZFP103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP103 BINDING SITE, designated SEQ ID:12219, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63769] Another function of VGAM1924 is therefore inhibition of

Zinc Finger Protein 103 Homolog (mouse) (ZFP103, Accession NM\_005667). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP103. Zinc Finger Protein 135 (clone pHZ-17) (ZNF135, Accession NM\_003436) is another VGAM1924 host target gene. ZNF135 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF135 BINDING SITE, designated SEQ ID:9491, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63770] Another function of VGAM1924 is therefore inhibition of Zinc Finger Protein 135 (clone pHZ-17) (ZNF135, Accession NM\_003436). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF135. Zinc Finger Protein 264 (ZNF264, Accession NM\_003417) is another VGAM1924 host target gene. ZNF264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by ZNF264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF264 BINDING SITE, designated SEQ ID:9456, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63771] Another function of VGAM1924 is therefore inhibition of Zinc Finger Protein 264 (ZNF264, Accession NM\_003417). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF264. AF311304 (Accession NM\_031214) is another VGAM1924 host target gene. AF311304 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AF311304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF311304 BINDING SITE, designated SEQ ID:25261, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63772] Another function of VGAM1924 is therefore inhibition of

AF311304 (Accession NM\_031214). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF311304. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM1924 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18370, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63773] Another function of VGAM1924 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. A Kinase (PRKA) Anchor Protein 5 (AKAP5, Accession NM\_004857) is another VGAM1924 host target gene. AKAP5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AKAP5, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP5 BINDING SITE, designated SEQ ID:11266, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63774] Another function of VGAM1924 is therefore inhibition of A Kinase (PRKA) Anchor Protein 5 (AKAP5, Accession NM\_004857). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP5. Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM\_015049) is another VGAM1924 host target gene. ALS2CR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALS2CR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2CR3 BINDING SITE, designated SEQ ID:17413, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63775] Another function of VGAM1924 is therefore inhibition of

Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM\_015049). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR3. ARAP3 (Accession NM\_022481) is another VGAM1924 host target gene. ARAP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARAP3 BINDING SITE, designated SEQ ID:22855, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63776] Another function of VGAM1924 is therefore inhibition of ARAP3 (Accession NM\_022481). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARAP3. ARTS-1 (Accession NM\_016442) is another VGAM1924 host target gene. ARTS-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARTS-1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARTS-1 BINDING SITE, designated SEQ ID:18563, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63777] Another function of VGAM1924 is therefore inhibition of ARTS-1 (Accession NM\_016442). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARTS-1. ATPase, (Na<sup>+</sup>)/K<sup>+</sup> Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM\_012069) is another VGAM1924 host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:14326, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63778] Another function of VGAM1924 is therefore inhibition of ATPase, (Na<sup>+</sup>)/K<sup>+</sup> Transporting, Beta 4 Polypeptide

(ATP1B4, Accession NM\_012069). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577) is another VGAM1924 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31082, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63779] Another function of VGAM1924 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM\_030577). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. BCAA (Accession NM\_016374) is another VGAM1924 host target gene. BCAA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BCAA, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCAA BINDING SITE, designated SEQ ID:18511, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63780] Another function of VGAM1924 is therefore inhibition of BCAA (Accession NM\_016374). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCAA. Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM\_017693) is another VGAM1924 host target gene. BIVM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIVM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:19254, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63781] Another function of VGAM1924 is therefore inhibition of Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM\_017693). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM. BS69 (Accession NM\_006624) is another VGAM1924 host target gene. BS69 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BS69, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BS69 BINDING SITE, designated SEQ ID:13408, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63782] Another function of VGAM1924 is therefore inhibition of BS69 (Accession NM\_006624). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BS69. Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM\_031418) is another VGAM1924 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:25403, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63783] Another function of VGAM1924 is therefore inhibition of Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM\_031418). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM\_014837) is another VGAM1924 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:16856, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63784] Another function of VGAM1924 is therefore inhibition of Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM\_014837). Accordingly, utilities of VGAM1924 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966) is another VGAM1924 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27530, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63785] Another function of VGAM1924 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM\_031910) is another VGAM1924 host target gene. C1QTNF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF6, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:25659, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63786] Another function of VGAM1924 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM\_031910). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6. Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM\_059257) is another VGAM1924 host target gene. C20orf142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf142 BINDING SITE, designated SEQ ID:36933, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63787] Another function of VGAM1924 is therefore inhibition of

Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM\_059257). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf142. Chromosome 20 Open Reading Frame 36 (C20orf36, Accession NM\_018257) is another VGAM1924 host target gene. C20orf36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf36 BINDING SITE, designated SEQ ID:20224, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63788] Another function of VGAM1924 is therefore inhibition of Chromosome 20 Open Reading Frame 36 (C20orf36, Accession NM\_018257). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf36. Chromosome 20 Open Reading Frame 55 (C20orf55, Accession NM\_031424) is another VGAM1924 host target gene. C20orf55 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by C20orf55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf55 BINDING SITE, designated SEQ ID:25407, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63789] Another function of VGAM1924 is therefore inhibition of Chromosome 20 Open Reading Frame 55 (C20orf55, Accession NM\_031424). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf55. Calcium Binding Atopy-related Autoantigen 1 (CBARA1, Accession NM\_006077) is another VGAM1924 host target gene. CBARA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CBARA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBARA1 BINDING SITE, designated SEQ ID:12722, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ

ID:4635.

[63790] Another function of VGAM1924 is therefore inhibition of Calcium Binding Atopy-related Autoantigen 1 (CBARA1, Accession NM\_006077). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBARA1. Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409) is another VGAM1924 host target gene. CCR6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE, designated SEQ ID:25378, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63791] Another function of VGAM1924 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM\_017424) is another VGAM1924 host target gene.

CECR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CECR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CECR1 BINDING SITE, designated SEQ ID:18882, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63792] Another function of VGAM1924 is therefore inhibition of Cat Eye Syndrome Chromosome Region, Candidate 1 (CECR1, Accession NM\_017424). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CECR1. CGI-127 (Accession NM\_016061) is another VGAM1924 host target gene. CGI-127 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGI-127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-127 BINDING SITE, designated SEQ ID:18137, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4635.

[63793] Another function of VGAM1924 is therefore inhibition of CGI-127 (Accession NM\_016061). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-127. CIP29 (Accession NM\_032364) is another VGAM1924 host target gene. CIP29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CIP29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIP29 BINDING SITE, designated SEQ ID:26149, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63794] Another function of VGAM1924 is therefore inhibition of CIP29 (Accession NM\_032364). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIP29. Cyclin M4 (CNNM4, Accession NM\_020184) is another VGAM1924 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM4, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNM4 BINDING SITE, designated SEQ ID:21426, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63795] Another function of VGAM1924 is therefore inhibition of Cyclin M4 (CNM4, Accession NM\_020184). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNM4. CCR4–NOT Transcription Complex, Subunit 8 (CNOT8, Accession NM\_004779) is another VGAM1924 host target gene. CNOT8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNOT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT8 BINDING SITE, designated SEQ ID:11182, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63796] Another function of VGAM1924 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 8 (CNOT8,

Accession NM\_004779). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT8. Collectin Sub-family Member 12 (COLEC12, Accession NM\_030781) is another VGAM1924 host target gene. COLEC12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COLEC12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLEC12 BINDING SITE, designated SEQ ID:25072, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63797] Another function of VGAM1924 is therefore inhibition of Collectin Sub-family Member 12 (COLEC12, Accession NM\_030781). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC12. COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM\_022730) is another VGAM1924 host target gene. COPS7B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by COPS7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COPS7B BINDING SITE, designated SEQ ID:22934, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63798] Another function of VGAM1924 is therefore inhibition of COP9 Constitutive Photomorphogenic Homolog Subunit 7B (Arabidopsis) (COPS7B, Accession NM\_022730). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COPS7B. CCCTC-binding Factor (zinc finger protein) (CTCF, Accession NM\_006565) is another VGAM1924 host target gene. CTCF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTCF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTCF BINDING SITE, designated SEQ ID:13335, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63799] Another function of VGAM1924 is therefore inhibition of CCCTC-binding Factor (zinc finger protein) (CTCF, Accession NM\_006565). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTCF. Chromosome Y Open Reading Frame 15B (CYorf15B, Accession NM\_032576) is another VGAM1924 host target gene. CYorf15B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYorf15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYorf15B BINDING SITE, designated SEQ ID:26304, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63800] Another function of VGAM1924 is therefore inhibition of Chromosome Y Open Reading Frame 15B (CYorf15B, Accession NM\_032576). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYorf15B. DDM36 (Accession NM\_020962) is another VGAM1924 host target gene. DDM36 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by DDM36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:21956, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63801] Another function of VGAM1924 is therefore inhibition of DDM36 (Accession NM\_020962). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 18 (Myc-regulated) (DDX18, Accession NM\_006773) is another VGAM1924 host target gene. DDX18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DDX18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX18 BINDING SITE, designated SEQ ID:13646, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63802] Another function of VGAM1924 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 18 (Myc-regulated) (DDX18, Accession NM\_006773). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX18. DiGeorge Syndrome Critical Region Gene 8 (DGCR8, Accession NM\_022720) is another VGAM1924 host target gene. DGCR8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DGCR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGCR8 BINDING SITE, designated SEQ ID:22920, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63803] Another function of VGAM1924 is therefore inhibition of DiGeorge Syndrome Critical Region Gene 8 (DGCR8, Accession NM\_022720). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGCR8. dj309H15.1 (Accession NM\_138574) is another VGAM1924 host target gene. dj309H15.1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by dj309H15.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of dj309H15.1 BINDING SITE, designated SEQ ID:28888, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63804] Another function of VGAM1924 is therefore inhibition of dj309H15.1 (Accession NM\_138574). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with dj309H15.1. DKFZp434D177 (Accession XM\_086586) is another VGAM1924 host target gene. DKFZp434D177 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp434D177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434D177 BINDING SITE, designated SEQ ID:38779, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63805] Another function of VGAM1924 is therefore inhibition of DKFZp434D177 (Accession XM\_086586). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434D177. DKFZP564B1023 (Accession NM\_031306) is another VGAM1924 host target gene. DKFZP564B1023 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564B1023, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B1023 BINDING SITE, designated SEQ ID:25344, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63806] Another function of VGAM1924 is therefore inhibition of DKFZP564B1023 (Accession NM\_031306). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B1023. DKFZP564I0422 (Accession NM\_031435) is another VGAM1924 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25437, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63807] Another function of VGAM1924 is therefore inhibition of DKFZP564I0422 (Accession NM\_031435). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I0422. DKFZp566H0824 (Accession NM\_017535) is another VGAM1924 host target gene. DKFZp566H0824 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp566H0824, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp566H0824 BINDING SITE, designated SEQ ID:18980, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63808] Another function of VGAM1924 is therefore inhibition of

DKFZp566H0824 (Accession NM\_017535). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp566H0824. DKFZp761D081 (Accession NM\_017610) is another VGAM1924 host target gene. DKFZp761D081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D081 BINDING SITE, designated SEQ ID:19104, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63809] Another function of VGAM1924 is therefore inhibition of DKFZp761D081 (Accession NM\_017610). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761D081. DKFZp761G0313 (Accession XM\_038026) is another VGAM1924 host target gene. DKFZp761G0313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G0313, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G0313 BINDING SITE, designated SEQ ID:32741, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63810] Another function of VGAM1924 is therefore inhibition of DKFZp761G0313 (Accession XM\_038026). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0313. DKFZp761G2113 (Accession XM\_046017) is another VGAM1924 host target gene. DKFZp761G2113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G2113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G2113 BINDING SITE, designated SEQ ID:34643, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63811] Another function of VGAM1924 is therefore inhibition of DKFZp761G2113 (Accession XM\_046017). Accordingly,

utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G2113. DKFZp761H079 (Accession NM\_144996) is another VGAM1924 host target gene. DKFZp761H079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761H079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761H079 BINDING SITE, designated SEQ ID:29601, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63812] Another function of VGAM1924 is therefore inhibition of DKFZp761H079 (Accession NM\_144996). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761H079. DKFZp762A227 (Accession NM\_017611) is another VGAM1924 host target gene. DKFZp762A227 BINDING SITE1 and DKFZp762A227 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZp762A227, corresponding to HOST TARGET binding sites such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762A227 BINDING SITE1 and DKFZp762A227 BINDING SITE2, designated SEQ ID:19106 and SEQ ID:15318 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63813] Another function of VGAM1924 is therefore inhibition of DKFZp762A227 (Accession NM\_017611). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762A227. ELL2 (Accession NM\_012081) is another VGAM1924 host target gene. ELL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELL2 BINDING SITE, designated SEQ ID:14368, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63814] Another function of VGAM1924 is therefore inhibition of ELL2 (Accession NM\_012081). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELL2. Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM\_017770) is another VGAM1924 host target gene. ELOVL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELOVL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELOVL2 BINDING SITE, designated SEQ ID:19390, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63815] Another function of VGAM1924 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM\_017770). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL2. Fibroblast Growth Factor 19 (FGF19, Accession NM\_005117) is another VGAM1924 host target gene. FGF19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF19, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF19 BINDING SITE, designated SEQ ID:11596, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63816] Another function of VGAM1924 is therefore inhibition of Fibroblast Growth Factor 19 (FGF19, Accession NM\_005117). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF19. FHX (Accession NM\_018416) is another VGAM1924 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:20461, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63817] Another function of VGAM1924 is therefore inhibition of FHX (Accession NM\_018416). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FHx. FLJ10246 (Accession NM\_018038) is another VGAM1924 host target gene. FLJ10246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10246 BINDING SITE, designated SEQ ID:19786, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63818] Another function of VGAM1924 is therefore inhibition of FLJ10246 (Accession NM\_018038). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10246. FLJ10298 (Accession NM\_018050) is another VGAM1924 host target gene. FLJ10298 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10298, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10298 BINDING SITE, designated SEQ ID:19808, to the nucleotide

sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63819] Another function of VGAM1924 is therefore inhibition of FLJ10298 (Accession NM\_018050). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10298. FLJ10535 (Accession NM\_018129) is another VGAM1924 host target gene. FLJ10535 BINDING SITE1 and FLJ10535 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ10535, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE1 and FLJ10535 BINDING SITE2, designated SEQ ID:19918 and SEQ ID:19921 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63820] Another function of VGAM1924 is therefore inhibition of FLJ10535 (Accession NM\_018129). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10724 (Accession NM\_018194) is another

VGAM1924 host target gene. FLJ10724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10724 BINDING SITE, designated SEQ ID:20052, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63821] Another function of VGAM1924 is therefore inhibition of FLJ10724 (Accession NM\_018194). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10724. FLJ10898 (Accession XM\_002486) is another VGAM1924 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE, designated SEQ ID:29896, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63822] Another function of VGAM1924 is therefore inhibition of FLJ10898 (Accession XM\_002486). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. FLJ10961 (Accession XM\_032826) is another VGAM1924 host target gene. FLJ10961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10961 BINDING SITE, designated SEQ ID:31776, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63823] Another function of VGAM1924 is therefore inhibition of FLJ10961 (Accession XM\_032826). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10961. FLJ11040 (Accession NM\_018307) is another VGAM1924 host target gene. FLJ11040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11040 BINDING SITE, designated SEQ ID:20296, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63824] Another function of VGAM1924 is therefore inhibition of FLJ11040 (Accession NM\_018307). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11040. FLJ11267 (Accession NM\_019607) is another VGAM1924 host target gene. FLJ11267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11267 BINDING SITE, designated SEQ ID:21226, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63825] Another function of VGAM1924 is therefore inhibition of FLJ11267 (Accession NM\_019607). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ11267. FLJ11275 (Accession NM\_018376) is another VGAM1924 host target gene. FLJ11275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11275 BINDING SITE, designated SEQ ID:20403, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63826] Another function of VGAM1924 is therefore inhibition of FLJ11275 (Accession NM\_018376). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11275. FLJ11320 (Accession NM\_018389) is another VGAM1924 host target gene. FLJ11320 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:20426, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM

RNA, also designated SEQ ID:4635.

[63827] Another function of VGAM1924 is therefore inhibition of FLJ11320 (Accession NM\_018389). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320. FLJ11506 (Accession NM\_024666) is another VGAM1924 host target gene. FLJ11506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11506 BINDING SITE, designated SEQ ID:23968, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63828] Another function of VGAM1924 is therefore inhibition of FLJ11506 (Accession NM\_024666). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11506. FLJ12619 (Accession NM\_030939) is another VGAM1924 host target gene. FLJ12619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12619, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12619 BINDING SITE, designated SEQ ID:25209, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63829] Another function of VGAM1924 is therefore inhibition of FLJ12619 (Accession NM\_030939). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12619. FLJ12960 (Accession NM\_024638) is another VGAM1924 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:23914, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63830] Another function of VGAM1924 is therefore inhibition of FLJ12960 (Accession NM\_024638). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ12960. FLJ13188 (Accession NM\_022063) is another VGAM1924 host target gene. FLJ13188 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13188, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13188 BINDING SITE, designated SEQ ID:22606, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63831] Another function of VGAM1924 is therefore inhibition of FLJ13188 (Accession NM\_022063). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13188. FLJ13213 (Accession NM\_024755) is another VGAM1924 host target gene. FLJ13213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13213 BINDING SITE, designated SEQ ID:24101, to the nucleotide

sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63832] Another function of VGAM1924 is therefore inhibition of FLJ13213 (Accession NM\_024755). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13213. FLJ13614 (Accession NM\_139076) is another VGAM1924 host target gene. FLJ13614 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13614, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13614 BINDING SITE, designated SEQ ID:29152, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63833] Another function of VGAM1924 is therefore inhibition of FLJ13614 (Accession NM\_139076). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13614. FLJ13646 (Accession NM\_024584) is another VGAM1924 host target gene. FLJ13646 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ13646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13646 BINDING SITE, designated SEQ ID:23812, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63834] Another function of VGAM1924 is therefore inhibition of FLJ13646 (Accession NM\_024584). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13646. FLJ14054 (Accession NM\_024563) is another VGAM1924 host target gene. FLJ14054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14054 BINDING SITE, designated SEQ ID:23784, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63835] Another function of VGAM1924 is therefore inhibition of FLJ14054 (Accession NM\_024563). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14054. FLJ14100 (Accession NM\_025025) is another VGAM1924 host target gene. FLJ14100 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14100 BINDING SITE, designated SEQ ID:24615, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63836] Another function of VGAM1924 is therefore inhibition of FLJ14100 (Accession NM\_025025). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14100. FLJ14641 (Accession NM\_032817) is another VGAM1924 host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641

BINDING SITE, designated SEQ ID:26588, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63837] Another function of VGAM1924 is therefore inhibition of FLJ14641 (Accession NM\_032817). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641. FLJ14803 (Accession NM\_032842) is another VGAM1924 host target gene. FLJ14803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:26629, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63838] Another function of VGAM1924 is therefore inhibition of FLJ14803 (Accession NM\_032842). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803. FLJ20038 (Accession NM\_017634) is another VGAM1924 host target gene. FLJ20038 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20038 BINDING SITE, designated SEQ ID:19140, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63839] Another function of VGAM1924 is therefore inhibition of FLJ20038 (Accession NM\_017634). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20038. FLJ20051 (Accession NM\_019087) is another VGAM1924 host target gene. FLJ20051 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20051 BINDING SITE, designated SEQ ID:21165, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63840] Another function of VGAM1924 is therefore inhibition of

FLJ20051 (Accession NM\_019087). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20051. FLJ20079 (Accession NM\_017656) is another VGAM1924 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19173, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63841] Another function of VGAM1924 is therefore inhibition of FLJ20079 (Accession NM\_017656). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ20136 (Accession NM\_017684) is another VGAM1924 host target gene. FLJ20136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19230, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63842] Another function of VGAM1924 is therefore inhibition of FLJ20136 (Accession NM\_017684). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136. FLJ20152 (Accession NM\_019000) is another VGAM1924 host target gene. FLJ20152 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20152, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20152 BINDING SITE, designated SEQ ID:21072, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63843] Another function of VGAM1924 is therefore inhibition of FLJ20152 (Accession NM\_019000). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20152. FLJ20277 (Accession NM\_017739) is another

VGAM1924 host target gene. FLJ20277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20277 BINDING SITE, designated SEQ ID:19330, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63844] Another function of VGAM1924 is therefore inhibition of FLJ20277 (Accession NM\_017739). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20277. FLJ20373 (Accession NM\_017792) is another VGAM1924 host target gene. FLJ20373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20373 BINDING SITE, designated SEQ ID:19428, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63845] Another function of VGAM1924 is therefore inhibition of FLJ20373 (Accession NM\_017792). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20373. FLJ20396 (Accession NM\_017801) is another VGAM1924 host target gene. FLJ20396 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20396 BINDING SITE, designated SEQ ID:19446, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63846] Another function of VGAM1924 is therefore inhibition of FLJ20396 (Accession NM\_017801). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20396. FLJ20445 (Accession NM\_017824) is another VGAM1924 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE, designated SEQ ID:19478, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63847] Another function of VGAM1924 is therefore inhibition of FLJ20445 (Accession NM\_017824). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445. FLJ20449 (Accession NM\_017826) is another VGAM1924 host target gene. FLJ20449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20449 BINDING SITE, designated SEQ ID:19487, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63848] Another function of VGAM1924 is therefore inhibition of FLJ20449 (Accession NM\_017826). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ20449. FLJ21415 (Accession NM\_024738) is another VGAM1924 host target gene. FLJ21415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21415 BINDING SITE, designated SEQ ID:24078, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63849] Another function of VGAM1924 is therefore inhibition of FLJ21415 (Accession NM\_024738). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21415. FLJ22029 (Accession NM\_024949) is another VGAM1924 host target gene. FLJ22029 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22029 BINDING SITE, designated SEQ ID:24507, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM

RNA, also designated SEQ ID:4635.

[63850] Another function of VGAM1924 is therefore inhibition of FLJ22029 (Accession NM\_024949). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22029. FLJ23151 (Accession NM\_024772) is another VGAM1924 host target gene. FLJ23151 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23151, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23151 BINDING SITE, designated SEQ ID:24137, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63851] Another function of VGAM1924 is therefore inhibition of FLJ23151 (Accession NM\_024772). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23151. FLJ23511 (Accession NM\_032239) is another VGAM1924 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23511, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25968, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63852] Another function of VGAM1924 is therefore inhibition of FLJ23511 (Accession NM\_032239). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. FLJ23563 (Accession XM\_041701) is another VGAM1924 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33565, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63853] Another function of VGAM1924 is therefore inhibition of FLJ23563 (Accession XM\_041701). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ23563. Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM\_033327) is another VGAM1924 host target gene. FUBP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FUBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUBP3 BINDING SITE, designated SEQ ID:31876, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63854] Another function of VGAM1924 is therefore inhibition of Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM\_033327). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUBP3. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM\_002077) is another VGAM1924 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7864, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63855] Another function of VGAM1924 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM\_002077). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM\_022130) is another VGAM1924 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:22686, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63856] Another function of VGAM1924 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Acces-

sion NM\_022130). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. GREB1 (Accession NM\_014668) is another VGAM1924 host target gene. GREB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GREB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GREB1 BINDING SITE, designated SEQ ID:16125, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63857] Another function of VGAM1924 is therefore inhibition of GREB1 (Accession NM\_014668). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GREB1. Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM\_043613) is another VGAM1924 host target gene. GRID1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRID1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of GRID1 BINDING SITE, designated SEQ ID:33979, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63858] Another function of VGAM1924 is therefore inhibition of Glutamate Receptor, Ionotropic, Delta 1 (GRID1, Accession XM\_043613). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRID1. H2AV (Accession NM\_138635) is another VGAM1924 host target gene. H2AV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2AV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AV BINDING SITE, designated SEQ ID:28913, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63859] Another function of VGAM1924 is therefore inhibition of H2AV (Accession NM\_138635). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AV.

HH114 (Accession NM\_032499) is another VGAM1924 host target gene. HH114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HH114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HH114 BINDING SITE, designated SEQ ID:26250, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63860] Another function of VGAM1924 is therefore inhibition of HH114 (Accession NM\_032499). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HH114. Histamine Receptor H4 (HRH4, Accession NM\_021624) is another VGAM1924 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22260, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA,

also designated SEQ ID:4635.

[63861] Another function of VGAM1924 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM\_021624). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. HSNOV1 (Accession NM\_017515) is another VGAM1924 host target gene. HSNOV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSNOV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSNOV1 BINDING SITE, designated SEQ ID:18965, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63862] Another function of VGAM1924 is therefore inhibition of HSNOV1 (Accession NM\_017515). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSNOV1. HSPC019 (Accession NM\_014028) is another VGAM1924 host target gene. HSPC019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by HSPC019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC019 BINDING SITE, designated SEQ ID:15252, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63863] Another function of VGAM1924 is therefore inhibition of HSPC019 (Accession NM\_014028). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC019. IBTK (Accession XM\_041401) is another VGAM1924 host target gene. IBTK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IBTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IBTK BINDING SITE, designated SEQ ID:33519, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63864] Another function of VGAM1924 is therefore inhibition of IBTK (Accession XM\_041401). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IBTK. Interleukin 14 (IL14, Accession XM\_170924) is another VGAM1924 host target gene. IL14 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IL14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL14 BINDING SITE, designated SEQ ID:45707, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63865] Another function of VGAM1924 is therefore inhibition of Interleukin 14 (IL14, Accession XM\_170924). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL14. Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM\_004979) is another VGAM1924 host target gene. KCND1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCND1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of KCND1 BINDING SITE, designated SEQ ID:11428, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63866] Another function of VGAM1924 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 1 (KCND1, Accession NM\_004979). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND1. KIAA0133 (Accession NM\_014777) is another VGAM1924 host target gene. KIAA0133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0133 BINDING SITE, designated SEQ ID:16611, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63867] Another function of VGAM1924 is therefore inhibition of KIAA0133 (Accession NM\_014777). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0133. KIAA0210 (Accession NM\_014744) is another VGAM1924 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:16420, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63868] Another function of VGAM1924 is therefore inhibition of KIAA0210 (Accession NM\_014744). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. KIAA0218 (Accession NM\_014760) is another VGAM1924 host target gene. KIAA0218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0218 BINDING SITE, designated SEQ ID:16520, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[63869] Another function of VGAM1924 is therefore inhibition of KIAA0218 (Accession NM\_014760). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0218. KIAA0232 (Accession XM\_052627) is another VGAM1924 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36035, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63870] Another function of VGAM1924 is therefore inhibition of KIAA0232 (Accession XM\_052627). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. KIAA0252 (Accession XM\_031646) is another VGAM1924 host target gene. KIAA0252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0252, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0252 BINDING SITE, designated SEQ ID:31450, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63871] Another function of VGAM1924 is therefore inhibition of KIAA0252 (Accession XM\_031646). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0252. KIAA0322 (Accession XM\_166591) is another VGAM1924 host target gene. KIAA0322 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0322, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0322 BINDING SITE, designated SEQ ID:44562, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63872] Another function of VGAM1924 is therefore inhibition of KIAA0322 (Accession XM\_166591). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0322. KIAA0332 (Accession XM\_031553) is another VGAM1924 host target gene. KIAA0332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0332 BINDING SITE, designated SEQ ID:31421, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63873] Another function of VGAM1924 is therefore inhibition of KIAA0332 (Accession XM\_031553). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0332. KIAA0408 (Accession NM\_014702) is another VGAM1924 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16233, to the

nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63874] Another function of VGAM1924 is therefore inhibition of KIAA0408 (Accession NM\_014702). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. KIAA0417 (Accession XM\_048898) is another VGAM1924 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35289, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63875] Another function of VGAM1924 is therefore inhibition of KIAA0417 (Accession XM\_048898). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA0438 (Accession NM\_014819) is another VGAM1924 host target gene. KIAA0438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0438 BINDING SITE, designated SEQ ID:16786, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63876] Another function of VGAM1924 is therefore inhibition of KIAA0438 (Accession NM\_014819). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0438. KIAA0478 (Accession NM\_014870) is another VGAM1924 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16986, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63877] Another function of VGAM1924 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA0493 (Accession XM\_034717) is another VGAM1924 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:32139, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63878] Another function of VGAM1924 is therefore inhibition of KIAA0493 (Accession XM\_034717). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. KIAA0565 (Accession XM\_039912) is another VGAM1924 host target gene. KIAA0565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0565 BINDING SITE, designated SEQ ID:33224, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63879] Another function of VGAM1924 is therefore inhibition of KIAA0565 (Accession XM\_039912). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0565. KIAA0648 (Accession XM\_094043) is another VGAM1924 host target gene. KIAA0648 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0648 BINDING SITE, designated SEQ ID:40221, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63880] Another function of VGAM1924 is therefore inhibition of KIAA0648 (Accession XM\_094043). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0648. KIAA0663 (Accession NM\_014827) is another VGAM1924 host target gene. KIAA0663 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:16812, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63881] Another function of VGAM1924 is therefore inhibition of KIAA0663 (Accession NM\_014827). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663. KIAA0779 (Accession XM\_098229) is another VGAM1924 host target gene. KIAA0779 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0779, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0779 BINDING SITE, designated SEQ ID:41503, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63882] Another function of VGAM1924 is therefore inhibition of

KIAA0779 (Accession XM\_098229). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0779. KIAA0830 (Accession XM\_045759) is another VGAM1924 host target gene. KIAA0830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0830 BINDING SITE, designated SEQ ID:34546, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63883] Another function of VGAM1924 is therefore inhibition of KIAA0830 (Accession XM\_045759). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0830. KIAA0854 (Accession NM\_014943) is another VGAM1924 host target gene. KIAA0854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0854 BINDING SITE, designated SEQ ID:17255, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63884] Another function of VGAM1924 is therefore inhibition of KIAA0854 (Accession NM\_014943). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0854. KIAA0865 (Accession XM\_028522) is another VGAM1924 host target gene. KIAA0865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0865 BINDING SITE, designated SEQ ID:30710, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63885] Another function of VGAM1924 is therefore inhibition of KIAA0865 (Accession XM\_028522). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0865. KIAA0884 (Accession XM\_046660) is another

VGAM1924 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34776, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63886] Another function of VGAM1924 is therefore inhibition of KIAA0884 (Accession XM\_046660). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. KIAA0894 (Accession NM\_014896) is another VGAM1924 host target gene. KIAA0894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0894 BINDING SITE, designated SEQ ID:17058, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63887] Another function of VGAM1924 is therefore inhibition of KIAA0894 (Accession NM\_014896). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0894. KIAA0907 (Accession NM\_014949) is another VGAM1924 host target gene. KIAA0907 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0907 BINDING SITE, designated SEQ ID:17276, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63888] Another function of VGAM1924 is therefore inhibition of KIAA0907 (Accession NM\_014949). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0907. KIAA0979 (Accession NM\_015032) is another VGAM1924 host target gene. KIAA0979 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0979, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0979 BINDING SITE, designated SEQ ID:17386, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63889] Another function of VGAM1924 is therefore inhibition of KIAA0979 (Accession NM\_015032). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0979. KIAA0981 (Accession XM\_028867) is another VGAM1924 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0981 BINDING SITE, designated SEQ ID:30797, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63890] Another function of VGAM1924 is therefore inhibition of KIAA0981 (Accession XM\_028867). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0981. KIAA1025 (Accession XM\_034056) is another VGAM1924 host target gene. KIAA1025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1025 BINDING SITE, designated SEQ ID:31997, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63891] Another function of VGAM1924 is therefore inhibition of KIAA1025 (Accession XM\_034056). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1025. KIAA1026 (Accession XM\_048825) is another VGAM1924 host target gene. KIAA1026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35274, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[63892] Another function of VGAM1924 is therefore inhibition of KIAA1026 (Accession XM\_048825). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. KIAA1055 (Accession XM\_038509) is another VGAM1924 host target gene. KIAA1055 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1055, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1055 BINDING SITE, designated SEQ ID:32850, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63893] Another function of VGAM1924 is therefore inhibition of KIAA1055 (Accession XM\_038509). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1055. KIAA1145 (Accession XM\_037790) is another VGAM1924 host target gene. KIAA1145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1145, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1145 BINDING SITE, designated SEQ ID:32680, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63894] Another function of VGAM1924 is therefore inhibition of KIAA1145 (Accession XM\_037790). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1145. KIAA1210 (Accession XM\_172801) is another VGAM1924 host target gene. KIAA1210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE, designated SEQ ID:46088, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63895] Another function of VGAM1924 is therefore inhibition of KIAA1210 (Accession XM\_172801). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1210. KIAA1233 (Accession XM\_032181) is another VGAM1924 host target gene. KIAA1233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1233 BINDING SITE, designated SEQ ID:31593, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63896] Another function of VGAM1924 is therefore inhibition of KIAA1233 (Accession XM\_032181). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1233. KIAA1277 (Accession XM\_035114) is another VGAM1924 host target gene. KIAA1277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1277 BINDING SITE, designated SEQ ID:32205, to the

nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63897] Another function of VGAM1924 is therefore inhibition of KIAA1277 (Accession XM\_035114). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1277. KIAA1323 (Accession XM\_032146) is another VGAM1924 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31564, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63898] Another function of VGAM1924 is therefore inhibition of KIAA1323 (Accession XM\_032146). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. KIAA1336 (Accession XM\_051306) is another VGAM1924 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35801, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63899] Another function of VGAM1924 is therefore inhibition of KIAA1336 (Accession XM\_051306). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. KIAA1357 (Accession XM\_050421) is another VGAM1924 host target gene. KIAA1357 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1357 BINDING SITE, designated SEQ ID:35628, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63900] Another function of VGAM1924 is therefore inhibition of KIAA1357 (Accession XM\_050421). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1357. KIAA1364 (Accession XM\_032997) is another VGAM1924 host target gene. KIAA1364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1364 BINDING SITE, designated SEQ ID:31813, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63901] Another function of VGAM1924 is therefore inhibition of KIAA1364 (Accession XM\_032997). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1364. KIAA1432 (Accession XM\_039698) is another VGAM1924 host target gene. KIAA1432 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1432 BINDING SITE, designated SEQ ID:33153, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63902] Another function of VGAM1924 is therefore inhibition of KIAA1432 (Accession XM\_039698). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1432. KIAA1463 (Accession XM\_051160) is another VGAM1924 host target gene. KIAA1463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1463 BINDING SITE, designated SEQ ID:35775, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63903] Another function of VGAM1924 is therefore inhibition of KIAA1463 (Accession XM\_051160). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1463. KIAA1495 (Accession XM\_055080) is another VGAM1924 host target gene. KIAA1495 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1495 BINDING SITE, designated SEQ ID:36225, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63904] Another function of VGAM1924 is therefore inhibition of KIAA1495 (Accession XM\_055080). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1495. KIAA1505 (Accession XM\_168469) is another VGAM1924 host target gene. KIAA1505 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1505 BINDING SITE, designated SEQ ID:45194, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63905] Another function of VGAM1924 is therefore inhibition of

KIAA1505 (Accession XM\_168469). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1505. KIAA1509 (Accession XM\_029353) is another VGAM1924 host target gene. KIAA1509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1509 BINDING SITE, designated SEQ ID:30876, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63906] Another function of VGAM1924 is therefore inhibition of KIAA1509 (Accession XM\_029353). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1509. KIAA1594 (Accession XM\_050754) is another VGAM1924 host target gene. KIAA1594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1594 BINDING SITE, designated SEQ ID:35674, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63907] Another function of VGAM1924 is therefore inhibition of KIAA1594 (Accession XM\_050754). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1594. KIAA1610 (Accession XM\_040622) is another VGAM1924 host target gene. KIAA1610 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1610, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1610 BINDING SITE, designated SEQ ID:33342, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63908] Another function of VGAM1924 is therefore inhibition of KIAA1610 (Accession XM\_040622). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1610. KIAA1613 (Accession XM\_035946) is another

VGAM1924 host target gene. KIAA1613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1613 BINDING SITE, designated SEQ ID:32359, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63909] Another function of VGAM1924 is therefore inhibition of KIAA1613 (Accession XM\_035946). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1613. KIAA1727 (Accession XM\_034262) is another VGAM1924 host target gene. KIAA1727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1727 BINDING SITE, designated SEQ ID:32030, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63910] Another function of VGAM1924 is therefore inhibition of KIAA1727 (Accession XM\_034262). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1727. KIAA1765 (Accession XM\_047355) is another VGAM1924 host target gene. KIAA1765 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1765 BINDING SITE, designated SEQ ID:34956, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63911] Another function of VGAM1924 is therefore inhibition of KIAA1765 (Accession XM\_047355). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1765. KIAA1822 (Accession XM\_041566) is another VGAM1924 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33551, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63912] Another function of VGAM1924 is therefore inhibition of KIAA1822 (Accession XM\_041566). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. KIAA1918 (Accession XM\_054951) is another VGAM1924 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36217, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63913] Another function of VGAM1924 is therefore inhibition of KIAA1918 (Accession XM\_054951). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1918. Keratin, Hair, Basic, 2 (KRTHB2, Accession NM\_033033) is another VGAM1924 host target gene. KRTHB2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KRTHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRTHB2 BINDING SITE, designated SEQ ID:26925, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63914] Another function of VGAM1924 is therefore inhibition of Keratin, Hair, Basic, 2 (KRTHB2, Accession NM\_033033). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRTHB2. LALP1 (Accession NM\_020354) is another VGAM1924 host target gene. LALP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LALP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LALP1 BINDING SITE, designated SEQ

ID:21623, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63915] Another function of VGAM1924 is therefore inhibition of LALP1 (Accession NM\_020354). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LALP1. LIN-28 (Accession NM\_024674) is another VGAM1924 host target gene. LIN-28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIN-28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIN-28 BINDING SITE, designated SEQ ID:23979, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63916] Another function of VGAM1924 is therefore inhibition of LIN-28 (Accession NM\_024674). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIN-28. Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM\_004735) is another VGAM1924 host target

gene. LRRFIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRRFIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRFIP1 BINDING SITE, designated SEQ ID:11121, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63917] Another function of VGAM1924 is therefore inhibition of Leucine Rich Repeat (in FLII) Interacting Protein 1 (LRRFIP1, Accession NM\_004735). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRFIP1. Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM\_002758) is another VGAM1924 host target gene. MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP2K6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2,

designated SEQ ID:8643 and SEQ ID:25702 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63918] Another function of VGAM1924 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM\_002758). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K6. Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP4K3, Accession NM\_003618) is another VGAM1924 host target gene. MAP4K3 BINDING SITE1 and MAP4K3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP4K3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP4K3 BINDING SITE1 and MAP4K3 BINDING SITE2, designated SEQ ID:9683 and SEQ ID:20595 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63919] Another function of VGAM1924 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 3 (MAP4K3, Accession NM\_003618). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP4K3. MGC11034 (Accession NM\_031453) is another VGAM1924 host target gene. MGC11034 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC11034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11034 BINDING SITE, designated SEQ ID:25472, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63920] Another function of VGAM1924 is therefore inhibition of MGC11034 (Accession NM\_031453). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11034. MGC12335 (Accession NM\_032744) is another VGAM1924 host target gene. MGC12335 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC12335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC12335 BINDING SITE, designated SEQ ID:26476, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63921] Another function of VGAM1924 is therefore inhibition of MGC12335 (Accession NM\_032744). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12335. MGC12518 (Accession XM\_034301) is another VGAM1924 host target gene. MGC12518 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12518, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12518 BINDING SITE, designated SEQ ID:32046, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63922] Another function of VGAM1924 is therefore inhibition of MGC12518 (Accession XM\_034301). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12518. MGC13090 (Accession NM\_032711) is another VGAM1924 host target gene. MGC13090 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13090 BINDING SITE, designated SEQ ID:26429, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63923] Another function of VGAM1924 is therefore inhibition of MGC13090 (Accession NM\_032711). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13090. MGC13159 (Accession NM\_032927) is another VGAM1924 host target gene. MGC13159 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC13159, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13159 BINDING SITE, designated SEQ ID:26752, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63924] Another function of VGAM1924 is therefore inhibition of

MGC13159 (Accession NM\_032927). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13159. MGC13183 (Accession NM\_032358) is another VGAM1924 host target gene. MGC13183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13183 BINDING SITE, designated SEQ ID:26145, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63925] Another function of VGAM1924 is therefore inhibition of MGC13183 (Accession NM\_032358). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13183. MGC14258 (Accession NM\_032900) is another VGAM1924 host target gene. MGC14258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of MGC14258 BINDING SITE, designated SEQ ID:26723, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63926] Another function of VGAM1924 is therefore inhibition of MGC14258 (Accession NM\_032900). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14258. MGC14433 (Accession NM\_032904) is another VGAM1924 host target gene. MGC14433 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14433 BINDING SITE, designated SEQ ID:26726, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63927] Another function of VGAM1924 is therefore inhibition of MGC14433 (Accession NM\_032904). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14433. MGC15437 (Accession NM\_032873) is an-

other VGAM1924 host target gene. MGC15437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15437 BINDING SITE, designated SEQ ID:26690, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63928] Another function of VGAM1924 is therefore inhibition of MGC15437 (Accession NM\_032873). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15437. MGC2508 (Accession NM\_024327) is another VGAM1924 host target gene. MGC2508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2508 BINDING SITE, designated SEQ ID:23620, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63929] Another function of VGAM1924 is therefore inhibition of MGC2508 (Accession NM\_024327). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2508. MGC2747 (Accession NM\_024104) is another VGAM1924 host target gene. MGC2747 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2747 BINDING SITE, designated SEQ ID:23549, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63930] Another function of VGAM1924 is therefore inhibition of MGC2747 (Accession NM\_024104). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2747. MGC4643 (Accession NM\_032715) is another VGAM1924 host target gene. MGC4643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4643, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4643 BINDING SITE, designated SEQ ID:26439, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63931] Another function of VGAM1924 is therefore inhibition of MGC4643 (Accession NM\_032715). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4643. MGC4796 (Accession XM\_029031) is another VGAM1924 host target gene. MGC4796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4796 BINDING SITE, designated SEQ ID:30829, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63932] Another function of VGAM1924 is therefore inhibition of MGC4796 (Accession XM\_029031). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC4796. MGC8721 (Accession XM\_016499) is another VGAM1924 host target gene. MGC8721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC8721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC8721 BINDING SITE, designated SEQ ID:30267, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63933] Another function of VGAM1924 is therefore inhibition of MGC8721 (Accession XM\_016499). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC8721. Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM\_005930) is another VGAM1924 host target gene. MGEA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGEA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGEA6 BINDING SITE, designated SEQ ID:12562, to the nucleotide se-

quence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63934] Another function of VGAM1924 is therefore inhibition of Meningioma Expressed Antigen 6 (coiled-coil proline-rich) (MGEA6, Accession NM\_005930). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGEA6. MIDORI (Accession XM\_057651) is another VGAM1924 host target gene. MIDORI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIDORI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:36528, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63935] Another function of VGAM1924 is therefore inhibition of MIDORI (Accession XM\_057651). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MIDORI. Methylenetetrahydrofolate Dehydrogenase (NAD<sup>+</sup> dependent), Methylenetetrahydrofolate Cyclohydrolase

(MTHFD2, Accession NM\_006636) is another VGAM1924 host target gene. MTHFD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MTHFD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTHFD2 BINDING SITE, designated SEQ ID:13431, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63936] Another function of VGAM1924 is therefore inhibition of Methylene Tetrahydrofolate Dehydrogenase (NAD<sup>+</sup> dependent), Methenyltetrahydrofolate Cyclohydrolase (MTHFD2, Accession NM\_006636). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTHFD2. Myelin Transcription Factor 1 (MYT1, Accession NM\_004535) is another VGAM1924 host target gene. MYT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of MYT1 BINDING SITE, designated SEQ ID:10878, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63937] Another function of VGAM1924 is therefore inhibition of Myelin Transcription Factor 1 (MYT1, Accession NM\_004535). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYT1. Nucleosome Assembly Protein 1-like 1 (NAP1L1, Accession NM\_139207) is another VGAM1924 host target gene. NAP1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAP1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAP1L1 BINDING SITE, designated SEQ ID:29225, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63938] Another function of VGAM1924 is therefore inhibition of Nucleosome Assembly Protein 1-like 1 (NAP1L1, Accession NM\_139207). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAP1L1. Ninjurin 2

(NINJ2, Accession NM\_016533) is another VGAM1924 host target gene. NINJ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NINJ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NINJ2 BINDING SITE, designated SEQ ID:18603, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63939] Another function of VGAM1924 is therefore inhibition of Ninjurin 2 (NINJ2, Accession NM\_016533). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NINJ2. NIP30 (Accession NM\_024946) is another VGAM1924 host target gene. NIP30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIP30 BINDING SITE, designated SEQ ID:24498, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4635.

[63940] Another function of VGAM1924 is therefore inhibition of NIP30 (Accession NM\_024946). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIP30. Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512) is another VGAM1924 host target gene. NUDT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT13 BINDING SITE, designated SEQ ID:31665, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63941] Another function of VGAM1924 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT13. NY-REN-25 (Accession XM\_027116) is another VGAM1924 host target gene. NY-REN-25 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30419, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63942] Another function of VGAM1924 is therefore inhibition of NY-REN-25 (Accession XM\_027116). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. Ornithine Decarboxylase Antizyme 2 (OAZ2, Accession NM\_002537) is another VGAM1924 host target gene. OAZ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OAZ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OAZ2 BINDING SITE, designated SEQ ID:8376, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63943] Another function of VGAM1924 is therefore inhibition of

Ornithine Decarboxylase Antizyme 2 (OAZ2, Accession NM\_002537). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OAZ2. Oxysterol Binding Protein-like 11 (OSBPL11, Accession NM\_022776) is another VGAM1924 host target gene. OSBPL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL11 BINDING SITE, designated SEQ ID:23047, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63944] Another function of VGAM1924 is therefore inhibition of Oxysterol Binding Protein-like 11 (OSBPL11, Accession NM\_022776). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL11. Oxysterol Binding Protein-like 1A (OSBPL1A, Accession NM\_018030) is another VGAM1924 host target gene. OSBPL1A BINDING SITE1 through OSBPL1A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by OSBPL1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL1A BINDING SITE1 through OSBPL1A BINDING SITE3, designated SEQ ID:19770, SEQ ID:28422 and SEQ ID:27905 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63945] Another function of VGAM1924 is therefore inhibition of Oxysterol Binding Protein-like 1A (OSBPL1A, Accession NM\_018030). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL1A. PBEF (Accession NM\_005746) is another VGAM1924 host target gene. PBEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PBEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBEF BINDING SITE, designated SEQ ID:12308, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63946] Another function of VGAM1924 is therefore inhibition of

PBEF (Accession NM\_005746). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBEF. Protocadherin 20 (PCDH20, Accession NM\_022843) is another VGAM1924 host target gene. PCDH20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH20 BINDING SITE, designated SEQ ID:23139, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63947] Another function of VGAM1924 is therefore inhibition of Protocadherin 20 (PCDH20, Accession NM\_022843). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH20. PDZ Domain Containing 2 (PDZD2, Accession XM\_087705) is another VGAM1924 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39397, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63948] Another function of VGAM1924 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM\_087705). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255) is another VGAM1924 host target gene. PELI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PELI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PELI2 BINDING SITE, designated SEQ ID:22229, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63949] Another function of VGAM1924 is therefore inhibition of Pellino Homolog 2 (Drosophila) (PELI2, Accession NM\_021255). Accordingly, utilities of VGAM1924 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PELI2. Peroxisomal Biogenesis Factor 11B (PEX11B, Accession NM\_003846) is another VGAM1924 host target gene. PEX11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX11B BINDING SITE, designated SEQ ID:9944, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63950] Another function of VGAM1924 is therefore inhibition of Peroxisomal Biogenesis Factor 11B (PEX11B, Accession NM\_003846). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX11B. Phytoceramidase, Alkaline (PHCA, Accession NM\_018367) is another VGAM1924 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20377, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63951] Another function of VGAM1924 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM\_018367). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. PBX/knotted 1 Homeobox 2 (PKNOX2, Accession XM\_165574) is another VGAM1924 host target gene. PKNOX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKNOX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKNOX2 BINDING SITE, designated SEQ ID:43695, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63952] Another function of VGAM1924 is therefore inhibition of PBX/knotted 1 Homeobox 2 (PKNOX2, Accession XM\_165574). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with PKNOX2. Placenta-specific 3 (PLAC3, Accession XM\_045115) is another VGAM1924 host target gene. PLAC3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PLAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC3 BINDING SITE, designated SEQ ID:34370, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63953] Another function of VGAM1924 is therefore inhibition of Placenta-specific 3 (PLAC3, Accession XM\_045115). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC3. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1B (dopamine and cAMP regulated phosphoprotein, DARPP-32) (PPP1R1B, Accession NM\_032192) is another VGAM1924 host target gene. PPP1R1B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R1B BINDING SITE, designated SEQ ID:25908, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63954] Another function of VGAM1924 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 1B (dopamine and cAMP regulated phosphoprotein, DARPP-32) (PPP1R1B, Accession NM\_032192). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R1B. Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Alpha Isoform (PPP2R2A, Accession NM\_002717) is another VGAM1924 host target gene. PPP2R2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R2A BINDING SITE, designated SEQ ID:8583, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63955] Another function of VGAM1924 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Regulatory Subunit B (PR 52), Alpha Isoform (PPP2R2A, Accession NM\_002717). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R2A. PRAX-1 (Accession NM\_004758) is another VGAM1924 host target gene. PRAX-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRAX-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRAX-1 BINDING SITE, designated SEQ ID:11147, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63956] Another function of VGAM1924 is therefore inhibition of PRAX-1 (Accession NM\_004758). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRAX-1. PRO1048 (Accession NM\_018497) is another VGAM1924 host target gene. PRO1048 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PRO1048, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1048 BINDING SITE, designated SEQ ID:20564, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63957] Another function of VGAM1924 is therefore inhibition of PRO1048 (Accession NM\_018497). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1048. PRO1617 (Accession NM\_018587) is another VGAM1924 host target gene. PRO1617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1617 BINDING SITE, designated SEQ ID:20666, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63958] Another function of VGAM1924 is therefore inhibition of PRO1617 (Accession NM\_018587). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1617. Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814) is another VGAM1924 host target gene. PSMF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSMF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMF1 BINDING SITE, designated SEQ ID:13691, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63959] Another function of VGAM1924 is therefore inhibition of Proteasome (prosome, macropain) Inhibitor Subunit 1 (PI31) (PSMF1, Accession NM\_006814). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMF1. RAB10, Member RAS Oncogene Family (RAB10, Accession XM\_097979) is another VGAM1924 host target gene. RAB10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB10, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB10 BINDING SITE, designated SEQ ID:41283, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63960] Another function of VGAM1924 is therefore inhibition of RAB10, Member RAS Oncogene Family (RAB10, Accession XM\_097979). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB10. Rab11-FIP2 (Accession NM\_014904) is another VGAM1924 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17102, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63961] Another function of VGAM1924 is therefore inhibition of Rab11-FIP2 (Accession NM\_014904). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. RBAK (Accession NM\_021163) is another VGAM1924 host target gene. RBAK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBAK BINDING SITE, designated SEQ ID:22143, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63962] Another function of VGAM1924 is therefore inhibition of RBAK (Accession NM\_021163). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBAK. RI58 (Accession NM\_012420) is another VGAM1924 host target gene. RI58 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RI58, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RI58 BINDING SITE, designated SEQ

ID:14793, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63963] Another function of VGAM1924 is therefore inhibition of RI58 (Accession NM\_012420). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RI58. RMP (Accession NM\_003796) is another VGAM1924 host target gene. RMP BINDING SITE1 and RMP BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RMP, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RMP BINDING SITE1 and RMP BINDING SITE2, designated SEQ ID:9877 and SEQ ID:28680 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63964] Another function of VGAM1924 is therefore inhibition of RMP (Accession NM\_003796). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RMP. Rpo1-2 (Accession NM\_019014) is another VGAM1924

host target gene. Rpo1-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rpo1-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rpo1-2 BINDING SITE, designated SEQ ID:21099, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63965] Another function of VGAM1924 is therefore inhibition of Rpo1-2 (Accession NM\_019014). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rpo1-2. SCOP (Accession XM\_166290) is another VGAM1924 host target gene. SCOP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCOP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCOP BINDING SITE, designated SEQ ID:44104, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63966] Another function of VGAM1924 is therefore inhibition of SCOP (Accession XM\_166290). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCOP. SCYB11 (Accession XM\_113426) is another VGAM1924 host target gene. SCYB11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCYB11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB11 BINDING SITE, designated SEQ ID:42259, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63967] Another function of VGAM1924 is therefore inhibition of SCYB11 (Accession XM\_113426). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB11. SDF1 (Accession XM\_165565) is another VGAM1924 host target gene. SDF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SDF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDF1 BINDING SITE, designated SEQ ID:43689, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63968] Another function of VGAM1924 is therefore inhibition of SDF1 (Accession XM\_165565). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDF1. Serine Hydrolase-like (SERHL, Accession XM\_170987) is another VGAM1924 host target gene. SERHL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERHL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERHL BINDING SITE, designated SEQ ID:45757, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63969] Another function of VGAM1924 is therefore inhibition of Serine Hydrolase-like (SERHL, Accession XM\_170987). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with SERHL. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832) is another VGAM1924 host target gene. SLC26A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC26A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE, designated SEQ ID:27413, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63970] Another function of VGAM1924 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. Sorting Nexin 11 (SNX11, Accession NM\_013323) is another VGAM1924 host target gene. SNX11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX11 BINDING SITE, des-

ignated SEQ ID:14970, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63971] Another function of VGAM1924 is therefore inhibition of Sorting Nexin 11 (SNX11, Accession NM\_013323). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX11. Spir-1 (Accession XM\_035640) is another VGAM1924 host target gene. Spir-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Spir-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Spir-1 BINDING SITE, designated SEQ ID:32306, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63972] Another function of VGAM1924 is therefore inhibition of Spir-1 (Accession XM\_035640). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Spir-1. Synaptopodin 2 (SYNPO2, Accession XM\_050219) is another VGAM1924 host target gene. SYNPO2 BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYNPO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNPO2 BINDING SITE, designated SEQ ID:35594, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63973] Another function of VGAM1924 is therefore inhibition of Synaptopodin 2 (SYNPO2, Accession XM\_050219). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNPO2. Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NM\_080737) is another VGAM1924 host target gene. SYTL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYTL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL4 BINDING SITE, designated SEQ ID:28025, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63974] Another function of VGAM1924 is therefore inhibition of Synaptotagmin-like 4 (granuphilin-a) (SYTL4, Accession NM\_080737). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL4. TA-KRP (Accession NM\_032505) is another VGAM1924 host target gene. TA-KRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TA-KRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-KRP BINDING SITE, designated SEQ ID:26253, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63975] Another function of VGAM1924 is therefore inhibition of TA-KRP (Accession NM\_032505). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-KRP. TEB4 (Accession XM\_027156) is another VGAM1924 host target gene. TEB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEB4, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEB4 BINDING SITE, designated SEQ ID:30427, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63976] Another function of VGAM1924 is therefore inhibition of TEB4 (Accession XM\_027156). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEB4. TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM\_021809) is another VGAM1924 host target gene. TGIF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:22366, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63977] Another function of VGAM1924 is therefore inhibition of TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM\_021809). Accordingly, utilities of

VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2. T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM\_012454) is another VGAM1924 host target gene. TIAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAM2 BINDING SITE, designated SEQ ID:14825, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63978] Another function of VGAM1924 is therefore inhibition of T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM\_012454). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAM2. Toll-like Receptor 10 (TLR10, Accession NM\_030956) is another VGAM1924 host target gene. TLR10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TLR10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLR10 BINDING SITE, designated SEQ ID:25230, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63979] Another function of VGAM1924 is therefore inhibition of Toll-like Receptor 10 (TLR10, Accession NM\_030956). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR10. Tankyrase, TRF1-interacting Ankyrin-related ADP-ribose Polymerase 2 (TNKS2, Accession NM\_025235) is another VGAM1924 host target gene. TNKS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNKS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNKS2 BINDING SITE, designated SEQ ID:24912, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63980] Another function of VGAM1924 is therefore inhibition of Tankyrase, TRF1-interacting Ankyrin-related ADP-ribose

Polymerase 2 (TNKS2, Accession NM\_025235). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNKS2. TOPBP1 (Accession NM\_007027) is another VGAM1924 host target gene. TOPBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOPBP1 BINDING SITE, designated SEQ ID:13887, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63981] Another function of VGAM1924 is therefore inhibition of TOPBP1 (Accession NM\_007027). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOPBP1. TRAD (Accession NM\_007064) is another VGAM1924 host target gene. TRAD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TRAD BINDING SITE, designated SEQ ID:13930, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63982] Another function of VGAM1924 is therefore inhibition of TRAD (Accession NM\_007064). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAD. Tripartite Motif-containing 4 (TRIM4, Accession NM\_033017) is another VGAM1924 host target gene. TRIM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM4 BINDING SITE, designated SEQ ID:26902, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63983] Another function of VGAM1924 is therefore inhibition of Tripartite Motif-containing 4 (TRIM4, Accession NM\_033017). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TRIM4. VDU1 (Accession NM\_015017) is another VGAM1924 host target gene. VDU1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VDU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDU1 BINDING SITE, designated SEQ ID:17383, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63984] Another function of VGAM1924 is therefore inhibition of VDU1 (Accession NM\_015017). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDU1. VEZATIN (Accession NM\_017599) is another VGAM1924 host target gene. VEZATIN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VEZATIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEZATIN BINDING SITE, designated SEQ ID:19069, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4635.

[63985] Another function of VGAM1924 is therefore inhibition of VEZATIN (Accession NM\_017599). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEZATIN. Vacuolar Protein Sorting 4B (yeast) (VPS4B, Accession NM\_004869) is another VGAM1924 host target gene. VPS4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS4B BINDING SITE, designated SEQ ID:11296, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63986] Another function of VGAM1924 is therefore inhibition of Vacuolar Protein Sorting 4B (yeast) (VPS4B, Accession NM\_004869). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS4B. Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106) is another VGAM1924 host target gene. YAP1 BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12748, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63987] Another function of VGAM1924 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM\_016353) is another VGAM1924 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC2 BINDING SITE, designated SEQ ID:18493, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63988] Another function of VGAM1924 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM\_016353). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC113763 (Accession NM\_138434) is another VGAM1924 host target gene. LOC113763 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC113763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113763 BINDING SITE, designated SEQ ID:28803, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63989] Another function of VGAM1924 is therefore inhibition of LOC113763 (Accession NM\_138434). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113763. LOC115123 (Accession XM\_055276) is another VGAM1924 host target gene. LOC115123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115123, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115123 BINDING SITE, designated SEQ ID:36246, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63990] Another function of VGAM1924 is therefore inhibition of LOC115123 (Accession XM\_055276). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115123. LOC116437 (Accession XM\_058185) is another VGAM1924 host target gene. LOC116437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:36580, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63991] Another function of VGAM1924 is therefore inhibition of LOC116437 (Accession XM\_058185). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC116437. LOC119392 (Accession NM\_145247) is another VGAM1924 host target gene. LOC119392 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC119392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119392 BINDING SITE, designated SEQ ID:29759, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63992] Another function of VGAM1924 is therefore inhibition of LOC119392 (Accession NM\_145247). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119392. LOC123283 (Accession XM\_071829) is another VGAM1924 host target gene. LOC123283 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC123283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123283 BINDING SITE, designated SEQ ID:37425, to

the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63993] Another function of VGAM1924 is therefore inhibition of LOC123283 (Accession XM\_071829). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123283. LOC125144 (Accession XM\_058900) is another VGAM1924 host target gene. LOC125144 BINDING SITE1 and LOC125144 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC125144, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125144 BINDING SITE1 and LOC125144 BINDING SITE2, designated SEQ ID:36788 and SEQ ID:36789 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63994] Another function of VGAM1924 is therefore inhibition of LOC125144 (Accession XM\_058900). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125144. LOC130589 (Accession NM\_138801) is an-

other VGAM1924 host target gene. LOC130589 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130589 BINDING SITE, designated SEQ ID:29024, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63995] Another function of VGAM1924 is therefore inhibition of LOC130589 (Accession NM\_138801). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130589. LOC131873 (Accession XM\_067585) is another VGAM1924 host target gene. LOC131873 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131873 BINDING SITE, designated SEQ ID:37360, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63996] Another function of VGAM1924 is therefore inhibition of LOC131873 (Accession XM\_067585). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131873. LOC143465 (Accession XM\_096430) is another VGAM1924 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, designated SEQ ID:40364, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63997] Another function of VGAM1924 is therefore inhibition of LOC143465 (Accession XM\_096430). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC143666 (Accession XM\_096465) is another VGAM1924 host target gene. LOC143666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143666, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143666 BINDING SITE, designated SEQ ID:40369, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63998] Another function of VGAM1924 is therefore inhibition of LOC143666 (Accession XM\_096465). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143666. LOC145134 (Accession XM\_096722) is another VGAM1924 host target gene. LOC145134 BINDING SITE1 and LOC145134 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC145134, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145134 BINDING SITE1 and LOC145134 BINDING SITE2, designated SEQ ID:40500 and SEQ ID:40501 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[63999] Another function of VGAM1924 is therefore inhibition of LOC145134 (Accession XM\_096722). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145134. LOC145945 (Accession XM\_096908) is another VGAM1924 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40637, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64000] Another function of VGAM1924 is therefore inhibition of LOC145945 (Accession XM\_096908). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC146268 (Accession XM\_085397) is another VGAM1924 host target gene. LOC146268 BINDING SITE1 and LOC146268 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC146268, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC146268 BINDING SITE1 and LOC146268 BINDING SITE2, designated SEQ ID:38126 and SEQ ID:38123 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64001] Another function of VGAM1924 is therefore inhibition of LOC146268 (Accession XM\_085397). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146268. LOC146952 (Accession XM\_097138) is another VGAM1924 host target gene. LOC146952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146952 BINDING SITE, designated SEQ ID:40768, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64002] Another function of VGAM1924 is therefore inhibition of LOC146952 (Accession XM\_097138). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146952. LOC147219 (Accession XM\_097214) is another VGAM1924 host target gene. LOC147219 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147219, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147219 BINDING SITE, designated SEQ ID:40820, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64003] Another function of VGAM1924 is therefore inhibition of LOC147219 (Accession XM\_097214). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147219. LOC147622 (Accession XM\_097255) is another VGAM1924 host target gene. LOC147622 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147622 BINDING SITE, designated SEQ ID:40852, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[64004] Another function of VGAM1924 is therefore inhibition of LOC147622 (Accession XM\_097255). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147622. LOC147694 (Accession XM\_085843) is another VGAM1924 host target gene. LOC147694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147694 BINDING SITE, designated SEQ ID:38370, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64005] Another function of VGAM1924 is therefore inhibition of LOC147694 (Accession XM\_085843). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147694. LOC148530 (Accession XM\_097480) is another VGAM1924 host target gene. LOC148530 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148530, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148530 BINDING SITE, designated SEQ ID:40886, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64006] Another function of VGAM1924 is therefore inhibition of LOC148530 (Accession XM\_097480). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148530. LOC149302 (Accession XM\_086489) is another VGAM1924 host target gene. LOC149302 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149302 BINDING SITE, designated SEQ ID:38705, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64007] Another function of VGAM1924 is therefore inhibition of LOC149302 (Accession XM\_086489). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149302. LOC149332 (Accession XM\_097626) is another VGAM1924 host target gene. LOC149332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149332 BINDING SITE, designated SEQ ID:40983, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64008] Another function of VGAM1924 is therefore inhibition of LOC149332 (Accession XM\_097626). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149332. LOC150170 (Accession XM\_086799) is another VGAM1924 host target gene. LOC150170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150170 BINDING SITE, designated SEQ ID:38863, to

the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64009] Another function of VGAM1924 is therefore inhibition of LOC150170 (Accession XM\_086799). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150170. LOC150175 (Accession XM\_086806) is another VGAM1924 host target gene. LOC150175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150175 BINDING SITE, designated SEQ ID:38885, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64010] Another function of VGAM1924 is therefore inhibition of LOC150175 (Accession XM\_086806). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150175. LOC150215 (Accession XM\_086813) is another VGAM1924 host target gene. LOC150215 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC150215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150215 BINDING SITE, designated SEQ ID:38889, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64011] Another function of VGAM1924 is therefore inhibition of LOC150215 (Accession XM\_086813). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150215. LOC150218 (Accession XM\_086850) is another VGAM1924 host target gene. LOC150218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150218 BINDING SITE, designated SEQ ID:38916, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64012] Another function of VGAM1924 is therefore inhibition of LOC150218 (Accession XM\_086850). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150218. LOC150225 (Accession XM\_097870) is another VGAM1924 host target gene. LOC150225 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150225, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150225 BINDING SITE, designated SEQ ID:41191, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64013] Another function of VGAM1924 is therefore inhibition of LOC150225 (Accession XM\_097870). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150225. LOC150311 (Accession XM\_086858) is another VGAM1924 host target gene. LOC150311 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150311, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150311 BINDING SITE, designated SEQ ID:38926, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64014] Another function of VGAM1924 is therefore inhibition of LOC150311 (Accession XM\_086858). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150311. LOC150397 (Accession XM\_086907) is another VGAM1924 host target gene. LOC150397 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150397 BINDING SITE, designated SEQ ID:38963, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64015] Another function of VGAM1924 is therefore inhibition of LOC150397 (Accession XM\_086907). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150397. LOC150418 (Accession XM\_037522) is another VGAM1924 host target gene. LOC150418 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150418 BINDING SITE, designated SEQ ID:32637, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64016] Another function of VGAM1924 is therefore inhibition of LOC150418 (Accession XM\_037522). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150418. LOC150630 (Accession XM\_097931) is another VGAM1924 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41240, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64017] Another function of VGAM1924 is therefore inhibition of

LOC150630 (Accession XM\_097931). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC150819 (Accession XM\_097954) is another VGAM1924 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150819 BINDING SITE, designated SEQ ID:41248, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64018] Another function of VGAM1924 is therefore inhibition of LOC150819 (Accession XM\_097954). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. LOC151283 (Accession XM\_087154) is another VGAM1924 host target gene. LOC151283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC151283 BINDING SITE, designated SEQ ID:39092, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64019] Another function of VGAM1924 is therefore inhibition of LOC151283 (Accession XM\_087154). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151283. LOC151429 (Accession XM\_098059) is another VGAM1924 host target gene. LOC151429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151429 BINDING SITE, designated SEQ ID:41343, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64020] Another function of VGAM1924 is therefore inhibition of LOC151429 (Accession XM\_098059). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151429. LOC152024 (Accession XM\_087365) is an-

other VGAM1924 host target gene. LOC152024 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152024 BINDING SITE, designated SEQ ID:39199, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64021] Another function of VGAM1924 is therefore inhibition of LOC152024 (Accession XM\_087365). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152024. LOC152220 (Accession XM\_098176) is another VGAM1924 host target gene. LOC152220 BINDING SITE1 and LOC152220 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC152220, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152220 BINDING SITE1 and LOC152220 BINDING SITE2, designated SEQ ID:41445 and SEQ ID:41447 respectively, to the nucleotide se-

quence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64022] Another function of VGAM1924 is therefore inhibition of LOC152220 (Accession XM\_098176). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152220. LOC152926 (Accession XM\_087562) is another VGAM1924 host target gene. LOC152926 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152926 BINDING SITE, designated SEQ ID:39341, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64023] Another function of VGAM1924 is therefore inhibition of LOC152926 (Accession XM\_087562). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152926. LOC154739 (Accession XM\_098602) is another VGAM1924 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41723, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64024] Another function of VGAM1924 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC157858 (Accession XM\_098833) is another VGAM1924 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:41866, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64025] Another function of VGAM1924 is therefore inhibition of LOC157858 (Accession XM\_098833). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. LOC157918 (Accession XM\_098842) is another VGAM1924 host target gene. LOC157918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157918 BINDING SITE, designated SEQ ID:41897, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64026] Another function of VGAM1924 is therefore inhibition of LOC157918 (Accession XM\_098842). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157918. LOC158014 (Accession XM\_088442) is another VGAM1924 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158014 BINDING SITE, designated SEQ ID:39698, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64027] Another function of VGAM1924 is therefore inhibition of LOC158014 (Accession XM\_088442). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC158954 (Accession XM\_017340) is another VGAM1924 host target gene. LOC158954 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158954 BINDING SITE, designated SEQ ID:30314, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64028] Another function of VGAM1924 is therefore inhibition of LOC158954 (Accession XM\_017340). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158954. LOC161003 (Accession NM\_145286) is another VGAM1924 host target gene. LOC161003 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161003 BINDING SITE, designated SEQ ID:29803, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64029] Another function of VGAM1924 is therefore inhibition of LOC161003 (Accession NM\_145286). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161003. LOC164971 (Accession XM\_092280) is another VGAM1924 host target gene. LOC164971 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164971 BINDING SITE, designated SEQ ID:40115, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64030] Another function of VGAM1924 is therefore inhibition of

LOC164971 (Accession XM\_092280). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164971. LOC168667 (Accession XM\_166592) is another VGAM1924 host target gene. LOC168667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC168667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168667 BINDING SITE, designated SEQ ID:44565, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64031] Another function of VGAM1924 is therefore inhibition of LOC168667 (Accession XM\_166592). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168667. LOC196264 (Accession XM\_113683) is another VGAM1924 host target gene. LOC196264 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196264, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196264 BINDING SITE, designated SEQ ID:42335, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64032] Another function of VGAM1924 is therefore inhibition of LOC196264 (Accession XM\_113683). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196264. LOC196812 (Accession XM\_116868) is another VGAM1924 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43138, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64033] Another function of VGAM1924 is therefore inhibition of LOC196812 (Accession XM\_116868). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC197319 (Accession XM\_113862) is an-

other VGAM1924 host target gene. LOC197319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197319 BINDING SITE, designated SEQ ID:42476, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64034] Another function of VGAM1924 is therefore inhibition of LOC197319 (Accession XM\_113862). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197319. LOC199678 (Accession XM\_117111) is another VGAM1924 host target gene. LOC199678 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199678 BINDING SITE, designated SEQ ID:43229, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64035] Another function of VGAM1924 is therefore inhibition of LOC199678 (Accession XM\_117111). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199678. LOC200470 (Accession XM\_117235) is another VGAM1924 host target gene. LOC200470 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200470 BINDING SITE, designated SEQ ID:43311, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64036] Another function of VGAM1924 is therefore inhibition of LOC200470 (Accession XM\_117235). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200470. LOC201895 (Accession XM\_114396) is another VGAM1924 host target gene. LOC201895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201895, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201895 BINDING SITE, designated SEQ ID:42927, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64037] Another function of VGAM1924 is therefore inhibition of LOC201895 (Accession XM\_114396). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201895. LOC202934 (Accession XM\_117486) is another VGAM1924 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43468, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64038] Another function of VGAM1924 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC202934. LOC203536 (Accession XM\_114716) is another VGAM1924 host target gene. LOC203536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203536 BINDING SITE, designated SEQ ID:43058, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64039] Another function of VGAM1924 is therefore inhibition of LOC203536 (Accession XM\_114716). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203536. LOC219790 (Accession XM\_166124) is another VGAM1924 host target gene. LOC219790 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219790 BINDING SITE, designated SEQ ID:43905, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[64040] Another function of VGAM1924 is therefore inhibition of LOC219790 (Accession XM\_166124). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219790. LOC221061 (Accession XM\_167709) is another VGAM1924 host target gene. LOC221061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221061 BINDING SITE, designated SEQ ID:44771, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64041] Another function of VGAM1924 is therefore inhibition of LOC221061 (Accession XM\_167709). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221061. LOC221288 (Accession XM\_168058) is another VGAM1924 host target gene. LOC221288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221288, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221288 BINDING SITE, designated SEQ ID:44968, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64042] Another function of VGAM1924 is therefore inhibition of LOC221288 (Accession XM\_168058). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221288. LOC221474 (Accession XM\_166464) is another VGAM1924 host target gene. LOC221474 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221474, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221474 BINDING SITE, designated SEQ ID:44384, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64043] Another function of VGAM1924 is therefore inhibition of LOC221474 (Accession XM\_166464). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221474. LOC221830 (Accession XM\_166508) is another VGAM1924 host target gene. LOC221830 BINDING SITE1 and LOC221830 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC221830, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221830 BINDING SITE1 and LOC221830 BINDING SITE2, designated SEQ ID:44436 and SEQ ID:44439 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64044] Another function of VGAM1924 is therefore inhibition of LOC221830 (Accession XM\_166508). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221830. LOC222008 (Accession XM\_168361) is another VGAM1924 host target gene. LOC222008 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222008, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC222008 BINDING SITE, designated SEQ ID:45127, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64045] Another function of VGAM1924 is therefore inhibition of LOC222008 (Accession XM\_168361). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222008. LOC222128 (Accession XM\_166560) is another VGAM1924 host target gene. LOC222128 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222128 BINDING SITE, designated SEQ ID:44542, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64046] Another function of VGAM1924 is therefore inhibition of LOC222128 (Accession XM\_166560). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222128. LOC253019 (Accession XM\_170907) is an-

other VGAM1924 host target gene. LOC253019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253019 BINDING SITE, designated SEQ ID:45667, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64047] Another function of VGAM1924 is therefore inhibition of LOC253019 (Accession XM\_170907). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253019. LOC253223 (Accession XM\_170515) is another VGAM1924 host target gene. LOC253223 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253223 BINDING SITE, designated SEQ ID:45346, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64048] Another function of VGAM1924 is therefore inhibition of LOC253223 (Accession XM\_170515). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253223. LOC253258 (Accession XM\_172870) is another VGAM1924 host target gene. LOC253258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253258 BINDING SITE, designated SEQ ID:46147, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64049] Another function of VGAM1924 is therefore inhibition of LOC253258 (Accession XM\_172870). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253258. LOC253260 (Accession XM\_171097) is another VGAM1924 host target gene. LOC253260 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253260, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253260 BINDING SITE, designated SEQ ID:45909, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64050] Another function of VGAM1924 is therefore inhibition of LOC253260 (Accession XM\_171097). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253260. LOC253975 (Accession XM\_171130) is another VGAM1924 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:45934, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64051] Another function of VGAM1924 is therefore inhibition of LOC253975 (Accession XM\_171130). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253975. LOC255045 (Accession XM\_171243) is another VGAM1924 host target gene. LOC255045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255045 BINDING SITE, designated SEQ ID:46031, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64052] Another function of VGAM1924 is therefore inhibition of LOC255045 (Accession XM\_171243). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255045. LOC255326 (Accession XM\_172832) is another VGAM1924 host target gene. LOC255326 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255326 BINDING SITE, designated SEQ ID:46106, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[64053] Another function of VGAM1924 is therefore inhibition of LOC255326 (Accession XM\_172832). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255326. LOC255465 (Accession XM\_173206) is another VGAM1924 host target gene. LOC255465 BINDING SITE1 and LOC255465 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC255465, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE1 and LOC255465 BINDING SITE2, designated SEQ ID:46460 and SEQ ID:46445 respectively, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64054] Another function of VGAM1924 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC256273 (Accession XM\_172847) is another VGAM1924 host target gene. LOC256273 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256273 BINDING SITE, designated SEQ ID:46125, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64055] Another function of VGAM1924 is therefore inhibition of LOC256273 (Accession XM\_172847). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256273. LOC256277 (Accession XM\_170644) is another VGAM1924 host target gene. LOC256277 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256277 BINDING SITE, designated SEQ ID:45426, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64056] Another function of VGAM1924 is therefore inhibition of

LOC256277 (Accession XM\_170644). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256277. LOC256733 (Accession XM\_173116) is another VGAM1924 host target gene. LOC256733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256733 BINDING SITE, designated SEQ ID:46368, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64057] Another function of VGAM1924 is therefore inhibition of LOC256733 (Accession XM\_173116). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256733. LOC257441 (Accession XM\_170961) is another VGAM1924 host target gene. LOC257441 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257441 BINDING SITE, designated SEQ ID:45744, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64058] Another function of VGAM1924 is therefore inhibition of LOC257441 (Accession XM\_170961). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257441. LOC257486 (Accession XM\_045029) is another VGAM1924 host target gene. LOC257486 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257486 BINDING SITE, designated SEQ ID:34326, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64059] Another function of VGAM1924 is therefore inhibition of LOC257486 (Accession XM\_045029). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257486. LOC257513 (Accession XM\_175148) is an-

other VGAM1924 host target gene. LOC257513 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257513 BINDING SITE, designated SEQ ID:46640, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64060] Another function of VGAM1924 is therefore inhibition of LOC257513 (Accession XM\_175148). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257513. LOC257567 (Accession XM\_175241) is another VGAM1924 host target gene. LOC257567 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257567 BINDING SITE, designated SEQ ID:46699, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64061] Another function of VGAM1924 is therefore inhibition of LOC257567 (Accession XM\_175241). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257567. LOC51580 (Accession NM\_015874) is another VGAM1924 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18014, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64062] Another function of VGAM1924 is therefore inhibition of LOC51580 (Accession NM\_015874). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC51634 (Accession NM\_016024) is another VGAM1924 host target gene. LOC51634 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51634, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51634 BINDING SITE, designated SEQ ID:18103, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64063] Another function of VGAM1924 is therefore inhibition of LOC51634 (Accession NM\_016024). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51634. LOC54499 (Accession XM\_047479) is another VGAM1924 host target gene. LOC54499 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54499, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54499 BINDING SITE, designated SEQ ID:34967, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64064] Another function of VGAM1924 is therefore inhibition of LOC54499 (Accession XM\_047479). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC54499. LOC55885 (Accession NM\_018640) is another VGAM1924 host target gene. LOC55885 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC55885, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55885 BINDING SITE, designated SEQ ID:20713, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64065] Another function of VGAM1924 is therefore inhibition of LOC55885 (Accession NM\_018640). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55885. LOC56267 (Accession NM\_019610) is another VGAM1924 host target gene. LOC56267 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC56267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56267 BINDING SITE, designated SEQ ID:21227, to the nucleotide sequence of VGAM1924 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4635.

[64066] Another function of VGAM1924 is therefore inhibition of LOC56267 (Accession NM\_019610). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56267. LOC89932 (Accession XM\_027341) is another VGAM1924 host target gene. LOC89932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89932 BINDING SITE, designated SEQ ID:30489, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64067] Another function of VGAM1924 is therefore inhibition of LOC89932 (Accession XM\_027341). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89932. LOC90333 (Accession XM\_030958) is another VGAM1924 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90333, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31223, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64068] Another function of VGAM1924 is therefore inhibition of LOC90333 (Accession XM\_030958). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. LOC91149 (Accession XM\_036480) is another VGAM1924 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32458, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64069] Another function of VGAM1924 is therefore inhibition of LOC91149 (Accession XM\_036480). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC91149. LOC91286 (Accession XM\_037444) is another VGAM1924 host target gene. LOC91286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91286 BINDING SITE, designated SEQ ID:32624, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64070] Another function of VGAM1924 is therefore inhibition of LOC91286 (Accession XM\_037444). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91286. LOC91496 (Accession XM\_038788) is another VGAM1924 host target gene. LOC91496 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91496, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91496 BINDING SITE, designated SEQ ID:32915, to the

nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64071] Another function of VGAM1924 is therefore inhibition of LOC91496 (Accession XM\_038788). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91496. LOC91549 (Accession XM\_039115) is another VGAM1924 host target gene. LOC91549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91549 BINDING SITE, designated SEQ ID:33012, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64072] Another function of VGAM1924 is therefore inhibition of LOC91549 (Accession XM\_039115). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91549. LOC92231 (Accession XM\_043734) is another VGAM1924 host target gene. LOC92231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC92231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92231 BINDING SITE, designated SEQ ID:34009, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64073] Another function of VGAM1924 is therefore inhibition of LOC92231 (Accession XM\_043734). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92231. LOC92609 (Accession XM\_053074) is another VGAM1924 host target gene. LOC92609 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92609, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92609 BINDING SITE, designated SEQ ID:36061, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64074] Another function of VGAM1924 is therefore inhibition of LOC92609 (Accession XM\_053074). Accordingly, utilities

of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92609. LOC92973 (Accession XM\_048529) is another VGAM1924 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35189, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64075] Another function of VGAM1924 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. LOC93356 (Accession XM\_050744) is another VGAM1924 host target gene. LOC93356 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC93356 BINDING SITE, designated SEQ ID:35672, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64076] Another function of VGAM1924 is therefore inhibition of LOC93356 (Accession XM\_050744). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93356. LOC93380 (Accession XM\_051020) is another VGAM1924 host target gene. LOC93380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93380 BINDING SITE, designated SEQ ID:35725, to the nucleotide sequence of VGAM1924 RNA, herein designated VGAM RNA, also designated SEQ ID:4635.

[64077] Another function of VGAM1924 is therefore inhibition of LOC93380 (Accession XM\_051020). Accordingly, utilities of VGAM1924 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1925 (VGAM1925) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[64078] VGAM1925 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1925 was detected is described hereinabove with reference to Figs. 1–8.

[64079] VGAM1925 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[64080] VGAM1925 gene encodes a VGAM1925 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1925 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1925 precursor RNA is designated SEQ ID:1911, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1911 is located at position 5609 relative to the

genome of Canine Distemper Virus.

[64081] VGAM1925 precursor RNA folds onto itself, forming VGAM1925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[64082] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1925 folded precursor RNA into VGAM1925 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1925 RNA is designated SEQ ID:4636, and is provided hereinbelow with reference to the sequence listing part.

[64083] VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1925 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[64084] VGAM1925 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1925 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1925 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[64085] The complementary binding of VGAM1925 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1925 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1925 host target RNA into VGAM1925 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[64086] It is appreciated that VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1925 host target genes. The mRNA of each one of this plurality of VGAM1925 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1925 RNA, herein designated VGAM RNA, and which when bound by VGAM1925 RNA causes inhibition of translation of respective one or more VGAM1925 host target proteins.

[64087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1925 gene, herein designated VGAM GENE, on one or more VGAM1925 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[64088] It is yet further appreciated that a function of VGAM1925 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus. Specific functions, and accordingly utilities, of VGAM1925

correlate with, and may be deduced from, the identity of the host target genes which VGAM1925 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[64089] Nucleotide sequences of the VGAM1925 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1925 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1925 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1925 are further described hereinbelow with reference to Table 1.

[64090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1925 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1925 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[64091] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1925 gene, herein designated VGAM is inhibition of expression of VGAM1925 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1925 correlate with, and may be deduced

from, the identity of the target genes which VGAM1925 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[64092] A Disintegrin and Metalloproteinase Domain 8 (ADAM8, Accession NM\_001109) is a VGAM1925 host target gene. ADAM8 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ADAM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM8 BINDING SITE, designated SEQ ID:6765, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64093] A function of VGAM1925 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 8 (ADAM8, Accession NM\_001109). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM8. Adenomatosis Polyposis Coli (APC, Accession NM\_000038) is another VGAM1925 host target gene. APC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APC, corresponding to a HOST TAR-

GET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APC BINDING SITE, designated SEQ ID:5483, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64094] Another function of VGAM1925 is therefore inhibition of Adenomatosis Polyposis Coli (APC, Accession NM\_000038). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APC. ADP-ribosylation Factor 3 (ARF3, Accession NM\_001659) is another VGAM1925 host target gene. ARF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:7382, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64095] Another function of VGAM1925 is therefore inhibition of ADP-ribosylation Factor 3 (ARF3, Accession NM\_001659).

Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF3. ATPase, Cu<sup>++</sup> Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052) is another VGAM1925 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5498, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64096] Another function of VGAM1925 is therefore inhibition of ATPase, Cu<sup>++</sup> Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988) is another VGAM1925 host target gene. CDK10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK10, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE, designated SEQ ID:27555, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64097] Another function of VGAM1925 is therefore inhibition of Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM\_052988), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK10. The function of CDK10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Chromogranin A (parathyroid secretory protein 1) (CHGA, Accession NM\_001275) is another VGAM1925 host target gene. CHGA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHGA BIND-

ING SITE, designated SEQ ID:6940, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64098] Another function of VGAM1925 is therefore inhibition of Chromogranin A (parathyroid secretory protein 1) (CHGA, Accession NM\_001275), a gene which regulates dense-core secretory granule biogenesis and hormone sequestration. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHGA. The function of CHGA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM440. Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM\_013372) is another VGAM1925 host target gene. CKTSF1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKTSF1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKTSF1B1 BINDING SITE, designated SEQ ID:15027, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ

ID:4636.

[64099] Another function of VGAM1925 is therefore inhibition of Cysteine Knot Superfamily 1, BMP Antagonist 1 (CKTSF1B1, Accession NM\_013372), a gene which blocks signaling of bone morphogenetic protein (BMP) . Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKTSF1B1. The function of CKTSF1B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28.DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892) is another VGAM1925 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13765, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64100] Another function of VGAM1925 is therefore inhibition of

DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280. EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883) is another VGAM1925 host target gene. EGFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30969, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64101] Another function of VGAM1925 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with EGFL4. Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM\_001418) is another VGAM1925 host target gene. EIF4G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G2 BINDING SITE, designated SEQ ID:7117, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64102] Another function of VGAM1925 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM\_001418), a gene which is a repressor of translation. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G2. The function of EIF4G2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1065.Homeo Box D3 (HOXD3, Accession NM\_006898) is another VGAM1925 host target gene.

HOXD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD3 BINDING SITE, designated SEQ ID:13774, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64103] Another function of VGAM1925 is therefore inhibition of Homeo Box D3 (HOXD3, Accession NM\_006898), a gene which plays a role in the differentiation process of hematopoietic cells. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXD3. The function of HOXD3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1384. Hippocalcin (HPCA, Accession NM\_002143) is another VGAM1925 host target gene. HPCA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HPCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCA BINDING SITE, designated SEQ ID:7920, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64104] Another function of VGAM1925 is therefore inhibition of Hippocalcin (HPCA, Accession NM\_002143), a gene which may be an hippocampal calcium-binding protein. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCA. The function of HPCA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM114. Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM\_001560) is another VGAM1925 host target gene. IL13RA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL13RA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:7286, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4636.

[64105] Another function of VGAM1925 is therefore inhibition of Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM\_001560), a gene which binds il-13 with a low affinity. together with il-4r- alpha can form a functional receptor for il-13. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL13RA1. The function of IL13RA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM\_001569) is another VGAM1925 host target gene. IRAK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK1 BINDING SITE, designated SEQ ID:7301, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64106] Another function of VGAM1925 is therefore inhibition of

Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM\_001569). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK1. Pyrroline-5-carboxylate Reductase 1 (PYCR1, Accession XM\_046472) is another VGAM1925 host target gene. PYCR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYCR1 BINDING SITE, designated SEQ ID:34732, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64107] Another function of VGAM1925 is therefore inhibition of Pyrroline-5-carboxylate Reductase 1 (PYCR1, Accession XM\_046472), a gene which catalyzes the NAD(P)H-dependent conversion of pyrroline-5-carboxylate to proline. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYCR1. The function of PYCR1 and its association with various

diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.RAB36, Member RAS Oncogene Family (RAB36, Accession NM\_004914) is another VGAM1925 host target gene. RAB36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB36 BINDING SITE, designated SEQ ID:11350, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64108] Another function of VGAM1925 is therefore inhibition of RAB36, Member RAS Oncogene Family (RAB36, Accession NM\_004914), a gene which is involved in protein transport. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB36. The function of RAB36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM129.Transcription Factor AP-2 Gamma (activating

enhancer binding protein 2 gamma) (TFAP2C, Accession NM\_003222) is another VGAM1925 host target gene. TFAP2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFAP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFAP2C BINDING SITE, designated SEQ ID:9223, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64109] Another function of VGAM1925 is therefore inhibition of Transcription Factor AP-2 Gamma (activating enhancer binding protein 2 gamma) (TFAP2C, Accession NM\_003222), a gene which is a sequence-specific dna-binding protein that interacts with inducible viral and cellular enhancer elements to regulate transcription of selected genes. Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFAP2C. The function of TFAP2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM379.Tumor Necrosis Factor (ligand) Superfamily, Member 6 (TNFSF6, Accession NM\_000639) is another VGAM1925 host target gene. TNFSF6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TNFSF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF6 BINDING SITE, designated SEQ ID:6276, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64110] Another function of VGAM1925 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 6 (TNFSF6, Accession NM\_000639). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF6. Werner Syndrome (WRN, Accession NM\_000553) is another VGAM1925 host target gene. WRN BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WRN BINDING

SITE, designated SEQ ID:6168, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64111] Another function of VGAM1925 is therefore inhibition of Werner Syndrome (WRN, Accession NM\_000553). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WRN. Zic Family Member 3 Heterotaxy 1 (odd-paired homolog, Drosophila) (ZIC3, Accession NM\_003413) is another VGAM1925 host target gene. ZIC3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZIC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIC3 BINDING SITE, designated SEQ ID:9452, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64112] Another function of VGAM1925 is therefore inhibition of Zic Family Member 3 Heterotaxy 1 (odd-paired homolog, Drosophila) (ZIC3, Accession NM\_003413). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with ZIC3. APCL (Accession NM\_005883) is another VGAM1925 host target gene. APCL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by APCL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APCL BINDING SITE, designated SEQ ID:12504, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64113] Another function of VGAM1925 is therefore inhibition of APCL (Accession NM\_005883). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APCL. Ras Homolog Gene Family, Member U (ARHU, Accession NM\_021205) is another VGAM1925 host target gene. ARHU BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARHU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHU BINDING SITE, designated SEQ ID:22185, to the nucleotide sequence of VGAM1925 RNA, herein

designated VGAM RNA, also designated SEQ ID:4636.

[64114] Another function of VGAM1925 is therefore inhibition of Ras Homolog Gene Family, Member U (ARHU, Accession NM\_021205). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHU. Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172) is another VGAM1925 host target gene. C1orf34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf34 BINDING SITE, designated SEQ ID:30437, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64115] Another function of VGAM1925 is therefore inhibition of Chromosome 1 Open Reading Frame 34 (C1orf34, Accession XM\_027172). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf34. Chromosome 20 Open Reading Frame 55 (C20orf55, Accession NM\_031424) is another VGAM1925 host target gene.

C20orf55 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf55 BINDING SITE, designated SEQ ID:25408, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64116] Another function of VGAM1925 is therefore inhibition of Chromosome 20 Open Reading Frame 55 (C20orf55, Accession NM\_031424). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf55. DKFZP434L1435 (Accession XM\_166401) is another VGAM1925 host target gene. DKFZP434L1435 BINDING SITE1 through DKFZP434L1435 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZP434L1435, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L1435 BINDING SITE1 through DKFZP434L1435

BINDING SITE3, designated SEQ ID:44270, SEQ ID:46666 and SEQ ID:46704 respectively, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64117] Another function of VGAM1925 is therefore inhibition of DKFZP434L1435 (Accession XM\_166401). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L1435. ETAA16 (Accession NM\_019002) is another VGAM1925 host target gene. ETAA16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ETAA16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETAA16 BINDING SITE, designated SEQ ID:21074, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64118] Another function of VGAM1925 is therefore inhibition of ETAA16 (Accession NM\_019002). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETAA16. FASTK (Accession NM\_025096) is another

VGAM1925 host target gene. FASTK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FASTK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FASTK BINDING SITE, designated SEQ ID:24731, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64119] Another function of VGAM1925 is therefore inhibition of FASTK (Accession NM\_025096). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FASTK. FLJ13491 (Accession NM\_024623) is another VGAM1925 host target gene. FLJ13491 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13491, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13491 BINDING SITE, designated SEQ ID:23890, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64120] Another function of VGAM1925 is therefore inhibition of FLJ13491 (Accession NM\_024623). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13491. FLJ14154 (Accession NM\_024845) is another VGAM1925 host target gene. FLJ14154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14154 BINDING SITE, designated SEQ ID:24273, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64121] Another function of VGAM1925 is therefore inhibition of FLJ14154 (Accession NM\_024845). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14154. FLJ20343 (Accession NM\_017775) is another VGAM1925 host target gene. FLJ20343 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20343 BINDING SITE, designated SEQ ID:19401, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64122] Another function of VGAM1925 is therefore inhibition of FLJ20343 (Accession NM\_017775). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20343. FLJ22479 (Accession NM\_024900) is another VGAM1925 host target gene. FLJ22479 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22479 BINDING SITE, designated SEQ ID:24388, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64123] Another function of VGAM1925 is therefore inhibition of FLJ22479 (Accession NM\_024900). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ22479. FLJ23091 (Accession NM\_024911) is another VGAM1925 host target gene. FLJ23091 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23091, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23091 BINDING SITE, designated SEQ ID:24419, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64124] Another function of VGAM1925 is therefore inhibition of FLJ23091 (Accession NM\_024911). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23091. Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM\_004485) is another VGAM1925 host target gene. GNG4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNG4 BINDING SITE, designated SEQ ID:10814, to the nucleotide sequence of

VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64125] Another function of VGAM1925 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma 4 (GNG4, Accession NM\_004485). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNG4. HSPF2 (Accession NM\_005528) is another VGAM1925 host target gene. HSPF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPF2 BINDING SITE, designated SEQ ID:12049, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64126] Another function of VGAM1925 is therefore inhibition of HSPF2 (Accession NM\_005528). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPF2. Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM\_014271) is another VGAM1925 host target

gene. IL1RAPL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1RAPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1RAPL1 BINDING SITE, designated SEQ ID:15556, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64127] Another function of VGAM1925 is therefore inhibition of Interleukin 1 Receptor Accessory Protein-like 1 (IL1RAPL1, Accession NM\_014271). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1RAPL1. KIAA0408 (Accession NM\_014702) is another VGAM1925 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16236, to the nucleotide sequence of VGAM1925 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4636.

[64128] Another function of VGAM1925 is therefore inhibition of KIAA0408 (Accession NM\_014702). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. KIAA0855 (Accession NM\_015003) is another VGAM1925 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17378, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64129] Another function of VGAM1925 is therefore inhibition of KIAA0855 (Accession NM\_015003). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. KIAA1026 (Accession XM\_048825) is another VGAM1925 host target gene. KIAA1026 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1026, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1026 BINDING SITE, designated SEQ ID:35278, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64130] Another function of VGAM1925 is therefore inhibition of KIAA1026 (Accession XM\_048825). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1026. KIAA1203 (Accession XM\_049683) is another VGAM1925 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1203 BINDING SITE, designated SEQ ID:35474, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64131] Another function of VGAM1925 is therefore inhibition of KIAA1203 (Accession XM\_049683). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1203. KIAA1340 (Accession XM\_044836) is another VGAM1925 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:34301, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64132] Another function of VGAM1925 is therefore inhibition of KIAA1340 (Accession XM\_044836). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. MGC10715 (Accession NM\_024325) is another VGAM1925 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23617, to

the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64133] Another function of VGAM1925 is therefore inhibition of MGC10715 (Accession NM\_024325). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. MGC2603 (Accession NM\_024037) is another VGAM1925 host target gene. MGC2603 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2603, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2603 BINDING SITE, designated SEQ ID:23472, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64134] Another function of VGAM1925 is therefore inhibition of MGC2603 (Accession NM\_024037). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2603. N4BP3 (Accession XM\_038920) is another VGAM1925 host target gene. N4BP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by N4BP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of N4BP3 BINDING SITE, designated SEQ ID:32941, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64135] Another function of VGAM1925 is therefore inhibition of N4BP3 (Accession XM\_038920). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with N4BP3. PANK (Accession NM\_138316) is another VGAM1925 host target gene. PANK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PANK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PANK BINDING SITE, designated SEQ ID:28716, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64136] Another function of VGAM1925 is therefore inhibition of PANK (Accession NM\_138316). Accordingly, utilities of

VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PANK. Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751) is another VGAM1925 host target gene. PPFIA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPFIA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIA4 BINDING SITE, designated SEQ ID:34824, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64137] Another function of VGAM1925 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM\_046751). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIA4. RHO6 (Accession NM\_014470) is another VGAM1925 host target gene. RHO6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by RHO6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHO6 BINDING SITE, designated SEQ ID:15821, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64138] Another function of VGAM1925 is therefore inhibition of RHO6 (Accession NM\_014470). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHO6. Ring Finger Protein 24 (RNF24, Accession NM\_007219) is another VGAM1925 host target gene. RNF24 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RNF24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF24 BINDING SITE, designated SEQ ID:14087, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64139] Another function of VGAM1925 is therefore inhibition of Ring Finger Protein 24 (RNF24, Accession NM\_007219).

Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF24. RoXaN (Accession NM\_025013) is another VGAM1925 host target gene. RoXaN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RoXaN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RoXaN BINDING SITE, designated SEQ ID:24605, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64140] Another function of VGAM1925 is therefore inhibition of RoXaN (Accession NM\_025013). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RoXaN. Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM\_003152) is another VGAM1925 host target gene. STAT5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT5A BINDING SITE, designated SEQ ID:9129, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64141] Another function of VGAM1925 is therefore inhibition of Signal Transducer and Activator of Transcription 5A (STAT5A, Accession NM\_003152). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT5A. Synaptotagmin-like 2 (SYTL2, Accession NM\_032379) is another VGAM1925 host target gene. SYTL2 BINDING SITE1 and SYTL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SYTL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL2 BINDING SITE1 and SYTL2 BINDING SITE2, designated SEQ ID:26175 and SEQ ID:26759 respectively, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64142] Another function of VGAM1925 is therefore inhibition of

Synaptotagmin-like 2 (SYTL2, Accession NM\_032379). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL2. Tubulin, Gamma Complex Associated Protein 3 (TUBGCP3, Accession NM\_006322) is another VGAM1925 host target gene. TUBGCP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUBGCP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUBGCP3 BINDING SITE, designated SEQ ID:13014, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64143] Another function of VGAM1925 is therefore inhibition of Tubulin, Gamma Complex Associated Protein 3 (TUBGCP3, Accession NM\_006322). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TUBGCP3. UPLC1 (Accession NM\_017707) is another VGAM1925 host target gene. UPLC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UPLC1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPLC1 BINDING SITE, designated SEQ ID:19285, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64144] Another function of VGAM1925 is therefore inhibition of UPLC1 (Accession NM\_017707). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPLC1. LOC121344 (Accession XM\_058555) is another VGAM1925 host target gene. LOC121344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121344 BINDING SITE, designated SEQ ID:36658, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64145] Another function of VGAM1925 is therefore inhibition of LOC121344 (Accession XM\_058555). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC121344. LOC124976 (Accession XM\_058879) is another VGAM1925 host target gene. LOC124976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124976 BINDING SITE, designated SEQ ID:36785, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64146] Another function of VGAM1925 is therefore inhibition of LOC124976 (Accession XM\_058879). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124976. LOC127845 (Accession XM\_059186) is another VGAM1925 host target gene. LOC127845 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC127845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127845 BINDING SITE, designated SEQ ID:36912, to

the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64147] Another function of VGAM1925 is therefore inhibition of LOC127845 (Accession XM\_059186). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127845. LOC137964 (Accession XM\_059933) is another VGAM1925 host target gene. LOC137964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC137964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC137964 BINDING SITE, designated SEQ ID:37113, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64148] Another function of VGAM1925 is therefore inhibition of LOC137964 (Accession XM\_059933). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC137964. LOC139231 (Accession XM\_060020) is another VGAM1925 host target gene. LOC139231 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC139231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139231 BINDING SITE, designated SEQ ID:37143, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64149] Another function of VGAM1925 is therefore inhibition of LOC139231 (Accession XM\_060020). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139231. LOC144266 (Accession XM\_084795) is another VGAM1925 host target gene. LOC144266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:37712, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64150] Another function of VGAM1925 is therefore inhibition of LOC144266 (Accession XM\_084795). Accordingly, utilities

of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266. LOC145826 (Accession XM\_096875) is another VGAM1925 host target gene. LOC145826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145826 BINDING SITE, designated SEQ ID:40610, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64151] Another function of VGAM1925 is therefore inhibition of LOC145826 (Accession XM\_096875). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145826. LOC148113 (Accession XM\_086058) is another VGAM1925 host target gene. LOC148113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC148113 BINDING SITE, designated SEQ ID:38472, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64152] Another function of VGAM1925 is therefore inhibition of LOC148113 (Accession XM\_086058). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148113. LOC149566 (Accession XM\_097670) is another VGAM1925 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41019, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64153] Another function of VGAM1925 is therefore inhibition of LOC149566 (Accession XM\_097670). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC152633 (Accession XM\_098248) is another VGAM1925 host target gene. LOC152633 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152633, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152633 BINDING SITE, designated SEQ ID:41535, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64154] Another function of VGAM1925 is therefore inhibition of LOC152633 (Accession XM\_098248). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152633. LOC153711 (Accession XM\_098419) is another VGAM1925 host target gene. LOC153711 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153711 BINDING SITE, designated SEQ ID:41670, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64155] Another function of VGAM1925 is therefore inhibition of

LOC153711 (Accession XM\_098419). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153711. LOC159148 (Accession XM\_099030) is another VGAM1925 host target gene. LOC159148 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE, designated SEQ ID:42079, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64156] Another function of VGAM1925 is therefore inhibition of LOC159148 (Accession XM\_099030). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. LOC196283 (Accession XM\_113684) is another VGAM1925 host target gene. LOC196283 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196283 BINDING SITE, designated SEQ ID:42341, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64157] Another function of VGAM1925 is therefore inhibition of LOC196283 (Accession XM\_113684). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196283. LOC197358 (Accession XM\_113872) is another VGAM1925 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42511, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64158] Another function of VGAM1925 is therefore inhibition of LOC197358 (Accession XM\_113872). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. LOC201799 (Accession XM\_114380) is an-

other VGAM1925 host target gene. LOC201799 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201799, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201799 BINDING SITE, designated SEQ ID:42918, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64159] Another function of VGAM1925 is therefore inhibition of LOC201799 (Accession XM\_114380). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201799. LOC201965 (Accession XM\_114412) is another VGAM1925 host target gene. LOC201965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201965 BINDING SITE, designated SEQ ID:42936, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64160] Another function of VGAM1925 is therefore inhibition of LOC201965 (Accession XM\_114412). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201965. LOC253891 (Accession XM\_170485) is another VGAM1925 host target gene. LOC253891 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253891 BINDING SITE, designated SEQ ID:45324, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64161] Another function of VGAM1925 is therefore inhibition of LOC253891 (Accession XM\_170485). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253891. LOC253897 (Accession XM\_171187) is another VGAM1925 host target gene. LOC253897 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253897, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253897 BINDING SITE, designated SEQ ID:45969, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64162] Another function of VGAM1925 is therefore inhibition of LOC253897 (Accession XM\_171187). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253897. LOC256806 (Accession XM\_172865) is another VGAM1925 host target gene. LOC256806 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256806 BINDING SITE, designated SEQ ID:46142, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64163] Another function of VGAM1925 is therefore inhibition of LOC256806 (Accession XM\_172865). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256806. LOC51608 (Accession XM\_033102) is another VGAM1925 host target gene. LOC51608 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51608 BINDING SITE, designated SEQ ID:31841, to the nucleotide sequence of VGAM1925 RNA, herein designated VGAM RNA, also designated SEQ ID:4636.

[64164] Another function of VGAM1925 is therefore inhibition of LOC51608 (Accession XM\_033102). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51608. LOC91694 (Accession XM\_040082) is another VGAM1925 host target gene. LOC91694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91694 BINDING SITE, designated SEQ ID:33251, to the nucleotide sequence of VGAM1925 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4636.

[64165] Another function of VGAM1925 is therefore inhibition of LOC91694 (Accession XM\_040082). Accordingly, utilities of VGAM1925 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91694. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1926 (VGAM1926) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[64166] VGAM1926 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1926 was detected is described hereinabove with reference to Figs. 1–8.

[64167] VGAM1926 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[64168] VGAM1926 gene encodes a VGAM1926 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1926 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1926 precursor RNA is designated SEQ ID:1912, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1912 is located at position 8304 relative to the genome of Canine Distemper Virus.

[64169] VGAM1926 precursor RNA folds onto itself, forming VGAM1926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[64170] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1926 folded precursor RNA into VGAM1926 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1926 RNA is designated SEQ ID:4637, and is provided hereinbelow with reference to the sequence listing part.

[64171] VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1926 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[64172] VGAM1926 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1926 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1926 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[64173] The complementary binding of VGAM1926 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1926 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1926 host target RNA into VGAM1926 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[64174] It is appreciated that VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1926 host target genes. The mRNA of

each one of this plurality of VGAM1926 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1926 RNA, herein designated VGAM RNA, and which when bound by VGAM1926 RNA causes inhibition of translation of respective one or more VGAM1926 host target proteins.

[64175] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1926 gene, herein designated VGAM GENE, on one or more VGAM1926 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[64176] It is yet further appreciated that a function of VGAM1926 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1926 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus. Specific functions, and accordingly utilities, of VGAM1926 correlate with, and may be deduced from, the identity of the host target genes which VGAM1926 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[64177] Nucleotide sequences of the VGAM1926 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1926 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1926 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1926 are further described hereinbelow with reference to Table 1.

[64178] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1926 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1926 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[64179] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1926 gene, herein designated VGAM is inhibition of expression of VGAM1926 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1926 correlate with, and may be deduced from, the identity of the target genes which VGAM1926 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[64180] Glycoprotein A Repetitions Predominant (GARP, Accession NM\_005512) is a VGAM1926 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:12035, to the nucleotide sequence of VGAM1926 RNA, herein designated VGAM RNA, also designated SEQ ID:4637.

[64181] A function of VGAM1926 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM\_005512). Accordingly, utilities of VGAM1926 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. ARPP-21 (Accession NM\_016300) is another VGAM1926 host target gene.

ARPP-21 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARPP-21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-21 BINDING SITE, designated SEQ ID:18421, to the nucleotide sequence of VGAM1926 RNA, herein designated VGAM RNA, also designated SEQ ID:4637.

[64182] Another function of VGAM1926 is therefore inhibition of ARPP-21 (Accession NM\_016300). Accordingly, utilities of VGAM1926 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-21. KIAA1577 (Accession XM\_035299) is another VGAM1926 host target gene. KIAA1577 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1577 BINDING SITE, designated SEQ ID:32209, to the nucleotide sequence of VGAM1926 RNA, herein designated VGAM RNA, also designated SEQ ID:4637.

[64183] Another function of VGAM1926 is therefore inhibition of KIAA1577 (Accession XM\_035299). Accordingly, utilities of VGAM1926 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577. MGC4400 (Accession NM\_032679) is another VGAM1926 host target gene. MGC4400 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4400 BINDING SITE, designated SEQ ID:26399, to the nucleotide sequence of VGAM1926 RNA, herein designated VGAM RNA, also designated SEQ ID:4637.

[64184] Another function of VGAM1926 is therefore inhibition of MGC4400 (Accession NM\_032679). Accordingly, utilities of VGAM1926 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4400. LOC145622 (Accession XM\_085186) is another VGAM1926 host target gene. LOC145622 BINDING SITE1

and LOC145622 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC145622, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE1 and LOC145622 BINDING SITE2, designated SEQ ID:37905 and SEQ ID:37906 respectively, to the nucleotide sequence of VGAM1926 RNA, herein designated VGAM RNA, also designated SEQ ID:4637.

[64185] Another function of VGAM1926 is therefore inhibition of LOC145622 (Accession XM\_085186). Accordingly, utilities of VGAM1926 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145622. WSB1 (Accession NM\_134265) is another VGAM1927 host target gene. WSB1 BINDING SITE1 and WSB1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WSB1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE1 and WSB1 BINDING SITE2, designated SEQ ID:28620 and SEQ ID:28614 respectively,

to the nucleotide sequence of VGAM1927 RNA, herein designated VGAM RNA, also designated SEQ ID:4638.

[64186] Another function of VGAM1927 is therefore inhibition of WSB1 (Accession NM\_134265). Accordingly, utilities of VGAM1927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. LOC144997 (Accession XM\_096702) is another VGAM1927 host target gene. LOC144997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144997 BINDING SITE, designated SEQ ID:40482, to the nucleotide sequence of VGAM1927 RNA, herein designated VGAM RNA, also designated SEQ ID:4638.

[64187] Another function of VGAM1927 is therefore inhibition of LOC144997 (Accession XM\_096702). Accordingly, utilities of VGAM1927 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1928 (VGAM1928) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[64188] VGAM1928 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1928 was detected is described hereinabove with reference to Figs. 1–8.

[64189] VGAM1928 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Distemper Virus. VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[64190] VGAM1928 gene encodes a VGAM1928 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1928 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1928 precursor RNA is designated SEQ ID:1914, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1914 is located at position 5392 relative to the genome of Canine Distemper Virus.

[64191] VGAM1928 precursor RNA folds onto itself, forming VGAM1928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[64192] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1928 folded precursor RNA into VGAM1928 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1928 RNA is designated SEQ ID:4639, and is provided hereinbelow with reference to the sequence listing part.

[64193] VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1928 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1928 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[64194] VGAM1928 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1928 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1928 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[64195] The complementary binding of VGAM1928 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1928 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1928 host target RNA into VGAM1928 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[64196] It is appreciated that VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1928 host target genes. The mRNA of each one of this plurality of VGAM1928 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1928 RNA, herein designated VGAM RNA, and which when bound by VGAM1928 RNA causes inhibition of translation of respective one or more VGAM1928 host target proteins.

[64197] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1928 gene, herein designated VGAM GENE, on one or more VGAM1928 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[64198] It is yet further appreciated that a function of VGAM1928 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of viral infection by Canine Distemper Virus. Specific functions, and accordingly utilities, of VGAM1928 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1928 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[64199] Nucleotide sequences of the VGAM1928 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1928 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1928 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1928 are further described hereinbelow with reference to Table 1.

[64200] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1928 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1928 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[64201] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1928 gene, herein designated VGAM is inhibition of expression of VGAM1928 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1928 correlate with, and may be deduced from, the identity of the target genes which VGAM1928

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[64202] Adenosine Deaminase, RNA-specific (ADAR, Accession NM\_001111) is a VGAM1928 host target gene. ADAR BINDING SITE1 through ADAR BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAR BINDING SITE1 through ADAR BINDING SITE3, designated SEQ ID:6772, SEQ ID:17958 and SEQ ID:17965 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64203] A function of VGAM1928 is therefore inhibition of Adenosine Deaminase, RNA-specific (ADAR, Accession NM\_001111), a gene which converts adenosine to inosine in double-stranded RNA. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAR. The function of ADAR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM323.A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM\_007203) is another VGAM1928 host target gene. AKAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14061, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64204] Another function of VGAM1928 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM\_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2. The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.Aldehyde Dehydrogenase 3 Family, Member B2 (ALDH3B2, Accession NM\_000695) is another VGAM1928 host target gene. ALDH3B2 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH3B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3B2 BINDING SITE, designated SEQ ID:6357, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64205] Another function of VGAM1928 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member B2 (ALDH3B2, Accession NM\_000695), a gene which may play a role in alcohol detoxitation. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3B2. The function of ALDH3B2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251. Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282) is another VGAM1928 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:6954, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64206] Another function of VGAM1928 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM\_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1126. Aprataxin (APTX, Accession NM\_017692) is another VGAM1928 host target gene. APTX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APTX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APTX BINDING SITE, designated SEQ ID:19248, to the nucleotide sequence of VGAM1928 RNA, herein

designated VGAM RNA, also designated SEQ ID:4639.

[64207] Another function of VGAM1928 is therefore inhibition of Aprataxin (APTX, Accession NM\_017692). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APTX. Apical Protein-like (Xenopus laevis) (APXL, Accession NM\_001649) is another VGAM1928 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7357, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64208] Another function of VGAM1928 is therefore inhibition of Apical Protein-like (Xenopus laevis) (APXL, Accession NM\_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM152. Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644) is another VGAM1928 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:20719 and SEQ ID:27631 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64209] Another function of VGAM1928 is therefore inhibition of Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM\_024812) is another VGAM1928 host target gene. BAALC BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by BAALC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAALC BINDING SITE, designated SEQ ID:24196, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64210] Another function of VGAM1928 is therefore inhibition of Brain and Acute Leukemia, Cytoplasmic (BAALC, Accession NM\_024812). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAALC. B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633) is another VGAM1928 host target gene. BCL2 BINDING SITE1 and BCL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BCL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2 BINDING SITE1 and BCL2 BINDING SITE2, designated SEQ ID:6251 and SEQ ID:6258 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64211] Another function of VGAM1928 is therefore inhibition of B-cell CLL/lymphoma 2 (BCL2, Accession NM\_000633). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2. Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093) is another VGAM1928 host target gene. CBFA2T2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFA2T2 BINDING SITE, designated SEQ ID:11549, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64212] Another function of VGAM1928 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 2 (CBFA2T2, Accession NM\_005093), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T2. The function of CBFA2T2 and its associa-

tion with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM152.CD28 Antigen (Tp44) (CD28, Accession NM\_006139) is another VGAM1928 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:12784, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64213] Another function of VGAM1928 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM\_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM281. CD44 Antigen (homing function and Indian blood group system) (CD44, Accession NM\_000610) is another VGAM1928 host target gene. CD44 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD44 BINDING SITE, designated SEQ ID:6211, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64214] Another function of VGAM1928 is therefore inhibition of CD44 Antigen (homing function and Indian blood group system) (CD44, Accession NM\_000610), a gene which is main cell surface receptor for hyaluronate, and involves in

matrix adhesion, lymphocyte activation and lymph node homing. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD44. The function of CD44 has been established by previous studies. Weber et al. (1996) noted that the CD44 gene encodes a transmembrane protein that is expressed as a family of molecular isoforms generated from alternative RNA splicing and posttranslational modifications. Certain CD44 isoforms that regulate activation and migration of lymphocytes and macrophages may also enhance local growth and metastatic spread of tumor cells. One ligand of CD44 is hyaluronic acid, binding of which to the NH<sub>2</sub>-terminal domain of CD44 enhances cellular aggregation and tumor cell growth. (Krainer et al. (1991) referred to CD44 as a 'hyaladherin' -- see 601269.) Weber et al. (1996) demonstrated that another ligand is osteopontin (OMIM Ref. No. 166490). Osteopontin induces cellular chemotaxis but not homotypic aggregation of cells, whereas the inverse is true for the interaction between CD44 and hyaluronate. The alternative responses to CD44 ligation may be exploited by tumor cells to allow OPN-mediated metastatic spread and hyaluronate-dependent growth in newly colo-

nized tissues in the process of tumor metastasis Animal model experiments lend further support to the function of CD44. Schmits et al. (1997) generated mice deficient in all known isoforms of Cd44 by targeting exons encoding the invariant N-terminal region of the molecule. Mice were born in mendelian ratio without any obvious developmental or neurologic deficits. Hematologic impairment was evidenced by altered tissue distribution of myeloid progenitors with increased levels of colony-forming unit-granulocyte-macrophage in bone marrow and reduced numbers in spleen. Fetal liver colony-forming unit-spleen and granulocyte colony-stimulating factor mobilization assays, together with reduced colony-forming unit-granulocyte-macrophage in peripheral blood, suggested that progenitor egress from the bone marrow was defective. Mice also developed exaggerated granuloma responses to *Cryptosporidium parvum* infection. Tumor studies showed that SV40-transformed Cd44-deficient fibroblasts were highly tumorigenic in nude mice, whereas reintroduction of Cd44 expression into these fibroblasts resulted in a dramatic inhibition of tumor growth.

[64215] It is appreciated that the abovementioned animal model for CD44 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[64216] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64217] Weber, G. F.; Ashkar, S.; Glimcher, M. J.; Cantor, H. : Receptor–ligand interaction between CD44 and osteopontin (Eta-1). Science 271: 509–512, 1996. ; and

[64218] Schmits, R.; Filmus, J.; Gerwin, N.; Senaldi, G.; Kiefer, F.; Kundig, T.; Wakeham, A.; Shahinian, A.; Catzavelos, C.; Rak, J.; Furlonger, C.; Zakarian, A.; Simard, J. J.; Ohashi, P. S.

[64219] Further studies establishing the function and utilities of CD44 are found in John Hopkins OMIM database record ID 107269, and in cited publications numbered 210–215, 5262–223, 4163–416 and 4205 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin–dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM\_058195) is another VGAM1928 host target gene. CDKN2A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDKN2A, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2A BINDING SITE, designated SEQ ID:27756, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64220] Another function of VGAM1928 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM\_058195). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2A. Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246) is another VGAM1928 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:15518, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64221] Another function of VGAM1928 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM\_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459. Chimerin (chimaerin) 1 (CHN1, Accession NM\_001822) is another VGAM1928 host target gene. CHN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHN1 BINDING SITE, designated SEQ ID:7561, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64222] Another function of VGAM1928 is therefore inhibition of Chimerin (chimaerin) 1 (CHN1, Accession NM\_001822), a gene which may play an important role in neuronal signal-

transduction mechanisms. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHN1. The function of CHN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM632. Cytoskeleton-associated Protein 1 (CKAP1, Accession XM\_056494) is another VGAM1928 host target gene. CKAP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CKAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKAP1 BINDING SITE, designated SEQ ID:36400, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64223] Another function of VGAM1928 is therefore inhibition of Cytoskeleton-associated Protein 1 (CKAP1, Accession XM\_056494). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKAP1. Chloride Channel 5 (nephrolithiasis 2, X-linked, Dent disease) (CLCN5, Acces-

sion NM\_000084) is another VGAM1928 host target gene. CLCN5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN5 BINDING SITE, designated SEQ ID:5536, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64224] Another function of VGAM1928 is therefore inhibition of Chloride Channel 5 (nephrolithiasis 2, X-linked, Dent disease) (CLCN5, Accession NM\_000084), a gene which may interfere in renal tubular function. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN5. The function of CLCN5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48. Collagen, Type IV, Alpha 4 (COL4A4, Accession NM\_000092) is another VGAM1928 host target gene. COL4A4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by

COL4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A4 BINDING SITE, designated SEQ ID:5551, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64225] Another function of VGAM1928 is therefore inhibition of Collagen, Type IV, Alpha 4 (COL4A4, Accession NM\_000092). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A4. Collagen, Type IV, Alpha 5 (Alport syndrome) (COL4A5, Accession NM\_000495) is another VGAM1928 host target gene. COL4A5 BINDING SITE1 through COL4A5 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A5 BINDING SITE1 through COL4A5 BINDING SITE3, designated SEQ ID:6109, SEQ ID:27215 and SEQ ID:27212 respectively, to the nucleotide sequence of VGAM1928 RNA,

herein designated VGAM RNA, also designated SEQ ID:4639.

[64226] Another function of VGAM1928 is therefore inhibition of Collagen, Type IV, Alpha 5 (Alport syndrome) (COL4A5, Accession NM\_000495). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A5. Cytochrome P450, 51 (lanosterol 14-alpha-demethylase) (CYP51, Accession NM\_000786) is another VGAM1928 host target gene. CYP51 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CYP51, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP51 BINDING SITE, designated SEQ ID:6437, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64227] Another function of VGAM1928 is therefore inhibition of Cytochrome P450, 51 (lanosterol 14-alpha-demethylase) (CYP51, Accession NM\_000786). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP51.

Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434) is another VGAM1928 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:44332, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64228] Another function of VGAM1928 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM\_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Diacylglycerol Kinase, Gamma 90kDa (DGKG, Accession NM\_001346) is another VGAM1928 host target gene. DGKG BINDING SITE is HOST

TARGET binding site found in the 3` untranslated region of mRNA encoded by DGKG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKG BINDING SITE, designated SEQ ID:7028, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64229] Another function of VGAM1928 is therefore inhibition of Diacylglycerol Kinase, Gamma 90kDa (DGKG, Accession NM\_001346), a gene which may convert diacylglycerol to phosphatidic acid. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKG. The function of DGKG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM451. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423) is another VGAM1928 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10700, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64230] Another function of VGAM1928 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM\_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57.EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is another VGAM1928 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41884, to the nucleotide sequence of VGAM1928 RNA,

herein designated VGAM RNA, also designated SEQ ID:4639.

[64231] Another function of VGAM1928 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Epithelial Membrane Protein 1 (EMP1, Accession NM\_001423) is another VGAM1928 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:7132, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64232] Another function of VGAM1928 is therefore inhibition of Epithelial Membrane Protein 1 (EMP1, Accession NM\_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with EMP1. The function of EMP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM107. Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM\_003633) is another VGAM1928 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:9700, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64233] Another function of VGAM1928 is therefore inhibition of Ectodermal-neural Cortex (with BTB-like domain) (ENC1, Accession NM\_003633), a gene which is an actin-binding protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233. Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM\_004447) is another VGAM1928 host target gene. EPS8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPS8 BINDING SITE, designated SEQ ID:10742, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64234] Another function of VGAM1928 is therefore inhibition of Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM\_004447), a gene which has a role in normal and neoplastic cell proliferation; contains an SH3 motif. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPS8. The function of EPS8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1533. Exostoses

(multiple) 2 (EXT2, Accession NM\_000401) is another VGAM1928 host target gene. EXT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXT2 BINDING SITE, designated SEQ ID:5975, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64235] Another function of VGAM1928 is therefore inhibition of Exostoses (multiple) 2 (EXT2, Accession NM\_000401). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXT2. Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455) is another VGAM1928 host target gene. EXTL1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL1 BINDING SITE, designated SEQ ID:10758, to the nucleotide sequence of VGAM1928 RNA,

herein designated VGAM RNA, also designated SEQ ID:4639.

[64236] Another function of VGAM1928 is therefore inhibition of Exostoses (multiple)-like 1 (EXTL1, Accession NM\_004455), a gene which probably contribute to the synthesis of heparan sulfate and heparin. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL1. The function of EXTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM806. Fibulin 1 (FBLN1, Accession NM\_006485) is another VGAM1928 host target gene. FBLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBLN1 BINDING SITE, designated SEQ ID:13211, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64237] Another function of VGAM1928 is therefore inhibition of

Fibulin 1 (FBLN1, Accession NM\_006485), a gene which secreted glycoprotein; has EGF-like repeats, similar to anaphylatoxins C3a, C4a, and C5a. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBLN1. The function of FBLN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1770. Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731) is another VGAM1928 host target gene. FCMD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCMD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCMD BINDING SITE, designated SEQ ID:13575, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64238] Another function of VGAM1928 is therefore inhibition of Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FCMD. Filaggrin (FLG, Accession XM\_048104) is another VGAM1928 host target gene. FLG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLG BINDING SITE, designated SEQ ID:35108, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64239] Another function of VGAM1928 is therefore inhibition of Filaggrin (FLG, Accession XM\_048104), a gene which aggregates keratin intermediate filaments . Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLG. The function of FLG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM899. Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806) is another VGAM1928 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31146, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64240] Another function of VGAM1928 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806), a gene which Filamin B, beta; binds actin, interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM416. Follistatin-like 1 (FSTL1, Accession NM\_007085) is another VGAM1928 host target gene. FSTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FSTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FSTL1 BINDING SITE, designated SEQ ID:13949, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64241] Another function of VGAM1928 is therefore inhibition of Follistatin-like 1 (FSTL1, Accession NM\_007085), a gene which may modulate the action of some growth factors on cell proliferation and differentiation. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FSTL1. The function of FSTL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM791. Galanin Receptor 1 (GALR1, Accession NM\_001480) is another VGAM1928 host target gene. GALR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALR1 BINDING SITE, designated SEQ ID:7217, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ

ID:4639.

[64242] Another function of VGAM1928 is therefore inhibition of Galanin Receptor 1 (GALR1, Accession NM\_001480), a gene which plays a role in regulating ion transport. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALR1. The function of GALR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1245. Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009) is another VGAM1928 host target gene. GJB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJB3 BINDING SITE, designated SEQ ID:23443, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64243] Another function of VGAM1928 is therefore inhibition of Gap Junction Protein, Beta 3, 31kDa (connexin 31) (GJB3, Accession NM\_024009). Accordingly, utilities of

VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJB3. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM\_002069) is another VGAM1928 host target gene. GNAI1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI1 BINDING SITE, designated SEQ ID:7840, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64244] Another function of VGAM1928 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM\_002069), a gene which is involved as modulators or transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI1. The function of GNAI1 and its association with various diseases and clinical conditions, has been established by previous studies, as de-

scribed hereinabove with reference to VGAM57. Golgi Re-assembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899) is another VGAM1928 host target gene. GORASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GORASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GORASP1 BINDING SITE, designated SEQ ID:25645, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64245] Another function of VGAM1928 is therefore inhibition of Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899), a gene which has some function with the Golgi apparatus. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1. The function of GORASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM630. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943) is an-

other VGAM1928 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38412, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64246] Another function of VGAM1928 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM\_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55.H3 Histone, Family 3B (H3.3B) (H3F3B, Accession NM\_005324) is another VGAM1928 host target gene. H3F3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H3F3B, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H3F3B BINDING SITE, designated SEQ ID:11796, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64247] Another function of VGAM1928 is therefore inhibition of H3 Histone, Family 3B (H3.3B) (H3F3B, Accession NM\_005324). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H3F3B. Huntingtin (Huntington disease) (HD, Accession NM\_002111) is another VGAM1928 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7893, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64248] Another function of VGAM1928 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession

NM\_002111). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 3A1 (HS3ST3A1, Accession NM\_006042) is another VGAM1928 host target gene. HS3ST3A1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HS3ST3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST3A1 BINDING SITE, designated SEQ ID:12678, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64249] Another function of VGAM1928 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 3A1 (HS3ST3A1, Accession NM\_006042), a gene which plays a role in the generation of heparan sulfate proteoglycan. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST3A1. The function of HS3ST3A1 and its association with various diseases and clinical conditions, has been established by previous stud-

ies, as described hereinabove with reference to VGAM1454. Intercellular Adhesion Molecule 1 (CD54), Human Rhinovirus Receptor (ICAM1, Accession XM\_049518) is another VGAM1928 host target gene. ICAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICAM1 BINDING SITE, designated SEQ ID:35441, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64250] Another function of VGAM1928 is therefore inhibition of Intercellular Adhesion Molecule 1 (CD54), Human Rhinovirus Receptor (ICAM1, Accession XM\_049518), a gene which binds the integrin LFA-1 (ITGB2) and promotes adhesion; member of the immunoglobulin superfamily. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICAM1. The function of ICAM1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1677. Inhibitor of DNA

Binding 4, Dominant Negative Helix-loop-helix Protein (ID4, Accession NM\_001546) is another VGAM1928 host target gene. ID4 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ID4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ID4 BINDING SITE, designated SEQ ID:7273, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64251] Another function of VGAM1928 is therefore inhibition of Inhibitor of DNA Binding 4, Dominant Negative Helix-loop-helix Protein (ID4, Accession NM\_001546), a gene which negatively regulates cell differentiation. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ID4. The function of ID4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM931. Isocitrate Dehydrogenase 1 (NADP+), Soluble (IDH1, Accession XM\_028869) is another VGAM1928 host target gene. IDH1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region

of mRNA encoded by IDH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH1 BINDING SITE, designated SEQ ID:30801, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64252] Another function of VGAM1928 is therefore inhibition of Isocitrate Dehydrogenase 1 (NADP+), Soluble (IDH1, Accession XM\_028869), a gene which decarboxylates isocitrate into alpha-ketoglutarate. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH1. The function of IDH1 has been established by previous studies. Henderson (1965) described electrophoretic polymorphism of this enzyme in mice. NADP-dependent IDH occurs in 2 structurally distinct forms: mitochondrial (OMIM Ref. No. 147650) and soluble (also called supernatant or cytoplasmic). Chen et al. (1972) found rare variants of the soluble form and concluded that the structural gene is probably autosomal and that it is distinct from the locus governing the mitochondrial form. Shows (1971) presented cell hybridization data suggesting that soluble

malate dehydrogenase and isocitrate dehydrogenase are syntenic. Using the cell-hybrid method which relies on interspecies variation rather than polymorphism, Boone et al. (1972) concluded that the IDH locus is on chromosome 20. The assignment of soluble IDH and soluble MDH (OMIM Ref. No. 154100) to chromosome 20 was withdrawn (Ruddle, 1973). Creagan et al. (1974) presented evidence that these 2 syntenic loci are on chromosome 2. From study of a balanced reciprocal translocation (X;2)(p22;q32) in man-mouse hybrids, Van Cong (1976) concluded that IDH1 is located in the region 2q32-qter. By dosage effect in cases of chromosome 2 aberrations, Narahara et al. (1985) concluded that the IDH1 locus is in 2q33.3, probably in the proximal portion. Glass et al. (1989) described a 16-year-old boy with deletion of the 2q32.2-q33.1 segment and normal levels of isocitrate dehydrogenase. Specific features included microphthalmia, corneal anomalies, beaked nose, ptosis, and cleft palate. In addition, the patient had a distinctive pattern of scalloped skin pigmentation, present from birth, which was approximately symmetrical on the trunk and proximal limbs and clearly demarcated from the normal skin. The distribution of pigmentation did not follow Blaschko lines.

There was no evidence of chromosomal mosaicism.

[64253] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[64254] Glass, I. A.; Swindlehurst, C. A.; Aitken, D. A.; McCrea, W.; Boyd, E. : Interstitial deletion of the long arm of chromosome 2 with normal levels of isocitrate dehydrogenase. J. Med. Genet. 26: 127–130, 1989. ; and

[64255] Narahara, K.; Kimura, S.; Kikkawa, K.; Takahashi, Y.; Wakita, Y.; Kasai, R.; Nagai, S.; Nishibayashi, Y.; Kimoto, H. : Probable assignment of soluble isocitrate dehydrogenase (IDH–1) to.

[64256] Further studies establishing the function and utilities of IDH1 are found in John Hopkins OMIM database record ID 147700, and in cited publications numbered 5248–5260 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin 11 (IL11, Accession NM\_000641) is another VGAM1928 host target gene. IL11 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of IL11 BINDING SITE, designated SEQ ID:6279, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64257] Another function of VGAM1928 is therefore inhibition of Interleukin 11 (IL11, Accession NM\_000641), a gene which stimulates the proliferation of hematopoietic stem cells and megakaryocyte progenitor cells and induces megakaryocyte maturation. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL11. The function of IL11 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM\_001560) is another VGAM1928 host target gene. IL13RA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL13RA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:7285, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ

ID:4639.

[64258] Another function of VGAM1928 is therefore inhibition of Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM\_001560), a gene which binds il-13 with a low affinity. together with il-4r- alpha can form a functional receptor for il-13. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL13RA1. The function of IL13RA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. Integrin, Beta 3 (platelet glycoprotein IIIa, antigen CD61) (ITGB3, Accession NM\_000212) is another VGAM1928 host target gene. ITGB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB3 BINDING SITE, designated SEQ ID:5709, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64259] Another function of VGAM1928 is therefore inhibition of

Integrin, Beta 3 (platelet glycoprotein IIIa, antigen CD61) (ITGB3, Accession NM\_000212). Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB3. Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM\_003024) is another VGAM1928 host target gene. ITSN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITSN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITSN1 BINDING SITE, designated SEQ ID:8956, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64260] Another function of VGAM1928 is therefore inhibition of Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM\_003024), a gene which may be involved in endocytosis and synaptic vesicle recycling. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITSN1. The function of ITSN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM1233.Jerky Homolog (mouse) (JRK, Accession XM\_098818) is another VGAM1928 host target gene. JRK BINDING SITE1 and JRK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JRK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRK BINDING SITE1 and JRK BINDING SITE2, designated SEQ ID:41839 and SEQ ID:41840 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64261] Another function of VGAM1928 is therefore inhibition of Jerky Homolog (mouse) (JRK, Accession XM\_098818), a gene which might function as a DNA-binding protein. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRK. The function of JRK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 7 (KCNA7, Accession NM\_031886) is another VGAM1928

host target gene. KCNA7 BINDING SITE1 through KCNA7 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KCNA7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA7 BINDING SITE1 through KCNA7 BINDING SITE4, designated SEQ ID:25627, SEQ ID:25629, SEQ ID:25630 and SEQ ID:25628 respectively, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.

[64262] Another function of VGAM1928 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 7 (KCNA7, Accession NM\_031886), a gene which allows nerve cells to efficiently repolarize following an action potential. Accordingly, utilities of VGAM1928 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA7. The function of KCNA7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126.V-maf Musculoaponeurotic Fibrosarcoma Oncogene Homolog F (avian) (MAFF, Accession

NM\_012323) is another VGAM1928 host target gene.

MAFF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAFF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAFF BINDING SITE, designated SEQ ID:14700, to the nucleotide sequence of VGAM1928 RNA, herein designated VGAM RNA, also designated SEQ ID:4639.
